Abstract x

## chapter 1

### Introduction 1

1.1 Context of the study 1
1.2 Statement of the research problem 1
1.3 The objectives of the studies described in this thesis 3
  1.3.1 Study aims 3
  1.3.2 Summary of activity to address the aims 3

### Methods 4

1.4.1 Conceptual framework of the study 4
1.4.2 Method 4
1.4.3 Analysis of the data 4

1.5 The significance of the described studies 6
1.6 Definitions of the key terms 7
1.7 Organization of the thesis 8

## chapter 2

### Literature review 11

2.1 Heart failure 11
  2.1.1 Heart failure with reduced ejection fraction (HFrEF) 11
  2.1.2 Heart failure with preserved ejection fraction (HFpEF) 11

2.2 Epidemiology 13
  2.2.1 Epidemiology of HFpEF 13
  2.2.2 Studies investigating Stage A of the disease 13
  2.2.3 Studies investigating Stage B of the disease 13
  2.2.4 Studies investigating Stage C of the disease 13

2.3 Pathophysiology and etiology 19
  2.3.1 Potential mechanisms of HFpEF/diastolic dysfunction 19
  2.3.2 Hypertension and HFpEF 19
  2.3.3 Reversible ischemia/previous infarcts 19
  2.3.4 Ageing and hypothyroidism 19
  2.3.5 Diabetes mellitus 19
  2.3.6 Acute pulmonary oedema and HFpEF 19

2.4 Diagnostic criteria for HFpEF 29
2.5 Assessment of HFpEF
   2.5.1 Cardiac catheterization
   2.5.2 Echocardiography
   2.5.3 Cardiopulmonary exercise testing (CPEX)
   2.5.4 Neurohormonal levels

2.6 Prognosis of HFpEF

2.7 Management of HFpEF
   2.7.1 Randomized controlled trials
   2.7.2 Observational and retrospective trials
   2.7.3 Future therapies

2.8 Scope of currently described studies

---

chapter 3

Methods, subject selection and subject characteristics

3.1 Introduction
   3.1.1 Sample selection
   3.1.2 Sample size considerations

3.2 Baseline characteristics and questionnaire for symptom status and quality of life
   3.2.1 Baseline characteristics
   3.2.2 Health questionnaire

3.3 Echocardiography
   Community echo protocol
   General instructions for all echo data acquisition
   Image acquisition

3.4 Cardiopulmonary exercise testing (CPEX)

3.5 Subject characteristics
   3.5.2 Dyspnoeic subjects’ characteristics

3.5. Subject characteristics based on CPEX performance

3.6 Baseline echo characteristics

3.7 Statistical analysis

---

chapter 4

Clinical, echocardiographic and exercise predictors of dyspnoea in the community

4.1 Introduction
   4.1.1 Evaluating abnormalities in exercise physiology
   4.1.2 Correlation of abnormal exercise physiology with diastolic parameters

4.2 Methods
   4.2.1 Study population
   4.2.2 Statistical analysis

4.3 Results
   4.3.1 Subject demographics
   4.3.2 Implications of diastolic dysfunction: Correlation with presence of symptoms
   4.3.3 Correlation between abnormal exercise physiology and resting diastolic abnormalities: Does VO2 max reflect diastolic function?
4.3.4 Beyond a single VO2 max cut off: Does stratification of VO2 max according to age and gender norms improve the correlation with resting diastolic abnormalities?

4.4 Discussion

Chapter 5

Is the ejection fraction in HFpEF ‘truly’ preserved? Defining the contribution of subtle systolic dysfunction to the pathophysiology of HFpEF

5.1 Introduction

5.2 Method
   5.2.2 Statistical analysis

5.3 Results
   5.3.1 Establishing the presence of systolic abnormalities and correlations with diastolic abnormalities in a dyspnoic cohort with preserved ejection fraction on echocardiography
   5.3.2 Correlating abnormal exercise physiology, subtle left ventricular systolic abnormalities and diastolic abnormalities

5.4 Discussion

Chapter 6

Conclusions and future directions

6.1 Review of the research

6.2 Future directions

Acknowledgements

I would like to take this opportunity to thank the numerous individuals who have helped me through the long journey towards this degree.

Firstly, my sincere and heartfelt thanks to my inspiring supervisors, initially in Birmingham with Professor Michael Frenneaux and subsequently in Adelaide with Professor John Horowitz. They have instilled in me the principles of research and the ability to resurrect a seemingly impossible situation. I also thank them for their support and help to complete the thesis.

I would next like to thank my colleagues who worked with me to complete this massive project, in particular Girish, Becky, Anne-Marie and Doni. I would especially single out Girish and Becky for keeping the project afloat during difficult times.

I would like to thank the University of Adelaide and the Research Foundation for my research stipend. A very special thank you to the British Heart Foundation for my stipend in the United Kingdom.

Finally I would like to thank my family and friends, especially, my wife, Sharmalar, who has stood by me through an extremely long and difficult process, and for her love and support during those times. My parents, brother and in-laws also have my deep gratitude for listening to all my complaints over the years.

I would like to dedicate my thesis to my beautiful children, Sharanya and Sarvin, who patiently let Daddy work on his thesis, when he should have been playing with them.
Abstract

Heart failure and preserved ejection fraction (HFpEF) is a syndrome that has experienced increasing interest over the last two decades, as there have been significant limitations in defining, diagnosing and treating the condition, as opposed to the great strides made in treating heart failure and reduced ejection fraction (HFrEF).

The limitations are related to the incomplete characterization of the affected individuals in epidemiological studies due to the lack of robust definitions for the syndrome, as well as the lack of easy to use and widely available investigational tools.

Most of the investigational tools measure resting cardiac physiological abnormalities, but the predominant symptom of HFpEF is exertional breathlessness, and therefore a robust investigational tool should be able to measure abnormal exercise physiology.

The contribution of subtle systolic impairment, despite a preserved overall ejection fraction to the pathophysiology of HFpEF, has not been fully established, which adds to the overall difficulties in diagnosis and establishing therapeutics.

The aims of this thesis were therefore to:

- establish the community prevalence and population characteristics of HFpEF
- determine the extent of correlation between the presence of abnormal exercise physiology of presumptive cardiac cause and that of impaired left ventricular relaxation/filling at rest
- determine whether minor impairment of left ventricular systolic function may represent a substantial contributor to the development of dyspnoea.

The studies from this doctoral thesis have established that not all patients with dyspnoea and a preserved ejection fraction are cardiac limited and dyspnoeic patients in a community setting are a heterogeneous group. The true prevalence of HFpEF in a community setting was established, albeit underestimated for reasons that are outlined in the thesis. The dyspnoeic group also have significantly more resting diastolic abnormalities than asymptomatic individuals, but the degree of difference was not strongly associated with symptomatic status.

Combining diastolic abnormalities had an incremental impact in predicting dyspnoea, but a significant number of dyspnoeic patients did not have more than one diastolic abnormality.

The significant but weak correlation between abnormal exercise physiology and that of impaired left ventricular relaxation/filling at rest was established. The correlation improved when abnormal exercise physiology was fully characterized with cardio-pulmonary exercise testing.

Finally, the presence of subtle systolic impairment in patients who were dyspnoeic with cardiac limitation was established. Combining resting systolic and diastolic abnormalities improved the correlation with abnormal exercise physiology.

Research from this doctoral thesis has contributed to the epidemiology, diagnostic algorithms and pathophysiology of HFpEF. Clinically this will help define the syndrome and aid in finding suitable therapeutics for the syndrome.
