

**An investigation into surface texture and *in-vitro* two-body wear
of CAD/CAM dental materials antagonised by acrylic denture
teeth**

Jonathan M Innes

Thesis submitted in partial fulfillment of the degree of
Doctor of Clinical Dentistry (Prosthodontics)

**The University of Adelaide
School of Dentistry, Faculty of Health Sciences**

December 2015

Preface

This thesis reports on research completed during my Doctorate of Clinical Dentistry (Prosthodontics) at the University of Adelaide, from January 2012 to December 2014.

Two primary aims of the project were firstly, to investigate surface texture analysis technology use on dental materials, and secondly, to complete a two-body *in-vitro* wear study of modern dental restorative materials opposing a standardized artificial acrylic tooth.

Table of Contents

Section 1- Introduction	1
1.1 Tooth Wear.....	2
1.1.1 Background.....	2
1.1.2 Aetiology of Tooth Wear.....	3
1.1.3 The Chewing Cycle.....	11
1.1.4 Methods of assessment of tooth wear.....	12
1.1.5 Surface texture analysis.....	14
1.1.6 Tribology.....	27
1.2 Relevant Dental Materials.....	33
1.2.1 Acrylic Prosthetic Teeth.....	33
1.2.2 Nano-Ceramic Composite Resin.....	35
1.2.3 Ceramics.....	36
1.3 In-Vitro Dental Material Tribology.....	51
1.3.1 General Considerations in <i>in-vitro</i> acrylic denture tooth testing.....	51
1.3.2 Material Wear Quantification.....	52
1.3.3 Standardising wear simulation research protocols.....	53
1.3.4 Dental Sample Material Test Parameters.....	53
1.4 Literature Review of Acrylic Denture Teeth Wear Testing.....	64
1.5 Rationale for this research.....	68
Section 2- Study Aims and Hypothesis	69
2.1 Study Aims.....	70
2.2 Null Hypotheses.....	71
Section 3- Methods and Materials	72
3.1 Sample Preparation.....	73
3.1.1 Monolithic Zirconia.....	73
3.1.2 Lithium Disilicate Specimen.....	76
3.1.3 Resin Nano-Ceramic (RNC).....	76
3.1.4 Artificial acrylic denture tooth material (PMMA).....	76
3.1.5 Antagonist Preparation (PMMA).....	77
3.2 Mounting.....	77
3.3 Scanning electron microscopy (SEM) observations and Surface texture quantification.....	80
3.3.1 MeX for <i>Sa</i> Analysis.....	81

3.3.2 Comparison of <i>Ra</i> and <i>Sa</i>	82
3.4 Profilometry	85
3.5 Wear testing machine	87
3.6 Wear machine protocols.....	90
3.6.1 Load (Applied Force).....	90
3.6.2 Lubrication.....	90
3.6.3 Type of Movement.....	91
3.6.4 Cycles (duration of experiment)	91
3.6.5 Cycling rate.....	92
3.6.6 Area of specimen contact.....	92
3.7 Experimental protocol.....	93
3.7.1 <i>In vitro</i> two-body Wear Study	93
3.7.2 Conclusions and Antagonistic Wear Study Protocols	95
3.7.3 Statistical Analysis.....	95
Section 4- Results	96
4.1 Qualitative Surface Texture	97
4.1.1 Pre-wear Surface Evaluation	97
4.1.2 Post wear surface evaluation.....	113
4.2 Quantitative (Post Wear) Surface Texture Analysis	128
4.2.1 <i>Ra</i> measurements post two body <i>in-vitro</i> wear testing of acrylic and sample materials.....	128
4.2.2 <i>Ra</i> values of acrylic antagonists and material specimens before and after two-body wear testing	131
4.3 Volumetric analysis: Acrylic Antagonist (AA) and Material sample specimen volume loss following 240,000 cycles of tribology testing (Volume loss in mm ³).	133
Section 5- Discussion	137
5.1 Baseline/Pre-testing material analysis.....	138
5.1.1 Qualitative Analysis.....	138
5.1.2 Quantitative Surface Texture Analysis	140
5.2 Post two-body <i>in-vitro</i> wear testing analysis	141
5.2.1 Qualitative analysis.....	141
5.2.2 Quantitative Analysis.....	143
5.2.3 Material Wear and Volume Changes.....	144
Section 6- Conclusions	146
6.1 Surface texture analysis.....	147

6.1.1	Baseline/Pre-Wear testing.....	147
6.1.2	Post two-body <i>in-vitro</i> wear testing.....	147
6.2	Volumetric changes of acrylic antagonist specimens and material sample specimens following	148
Section 7- References		149
Section 8- Appendices		165
8.1	Appendix 1 – Literature review table summary of in-vitro wear studies on artificial denture teeth	166
8.2	Appendix 2 – Complete set of baseline <i>Ra</i> and <i>Sa</i> values for all examined materials	174
8.3	Appendix 3 –Post two-body wear testing material loss (wear) in mm ³ for each two-body wear testing group (material sample and acrylic antagonist).....	176

Abstract

Introduction:

Wear of teeth and of dental materials is a normal chemical and biomechanical process and is one of the physical and behavioral characteristics of dental restorative materials that need to be understood when planning the incorporation of a dental restoration into the stomatognathic system. The aims for this investigation were to analyse and compare two-dimensional (*Ra*) and three-dimensional (*Sa*) methods for surface texture analysis and to apply these methods in a two-body *in-vitro* wear study using PMMA-acrylic denture teeth as antagonists and a range of commonly used dental restorative materials as test specimens. The material wear characteristics of the antagonist and sample materials were analysed both qualitatively and quantitatively in order to better improve the decisions made by clinicians

Methods and Materials:

The dental materials analysed are all commercially available CAD/CAM materials for clinical dentistry. They included three monolithic zirconia materials (BruxZir™, Lava Plus™, DenZir™), a lithium disilicate ceramic (eMax™), a nano-ceramic composite resin (Lava Ultimate™), and PMMA-acrylic denture teeth (Gnathostar™, Ivoclar Vivadent).

The first investigation involved SEM surface texture analysis of the materials using commonly applied 2-D (*Ra*) methodology and a novel 3-D (*Sa*) surface profile generation protocol (Me-X). Qualitative and quantitative information was considered to determine which method gave the most accurate and consistent results for dental material surface topography characterisation.

The second part of the investigation involved *in-vitro* two-body wear investigations using PMMA-acrylic denture teeth as an antagonist and samples from each of the test groups. A purpose-built wear simulator applied a load of 99.5N for 240,000 “chewing” cycles with distilled water lubrication. The total material volume loss for the test materials and PMMA-acrylic antagonist were analysed via 3-D surface profile methods. Qualitative analysis was undertaken via SEM.

Results:

Ra and *Sa* surface texture analysis and quantification indicated that the 3-D *Sa* method was more sensitive to surface topography variation in the materials than the 2-D *Ra* method. Both the *Ra* and *Sa* methods gave the same ranking of the materials in terms of which had more pronounced surface topography variation. The highest values were obtained for the PMMA-acrylic group, followed by Lava Plus™, DenZir™, Lava Ultimate™, eMax™, and BruxZir™ in descending *Ra* and *Sa* order. Post two-body wear testing analysis showed qualitative and quantitative changes in the materials. Obvious wear facets were noted for the acrylic antagonist and control groups and the Lava Ultimate™ test material. No wear facets were noted in the zirconia or eMax™ ceramic test samples.

The acrylic antagonist material showed the highest volume loss when opposing the nano-ceramic Lava Ultimate™ sample material, followed by the eMax™ group, then the acrylic control group. The Lava Plus™ group showed the least acrylic antagonist material volume loss. The highest overall test material volume loss occurred in the nano-ceramic composite resin (Lava Ultimate™), group followed closely by the acrylic-acrylic control group.

Conclusions:

The *Ra* and *Sa* surface texture analysis and quantification results indicated that either method could be used to analyse the surface roughness of dental materials. The *Ra* method was quicker and more cost effective than the *Sa* method. The highest values in descending *Ra* and *Sa* order were obtained for the PMMA-acrylic group, followed by Lava Plus™, DenZir™, Lava Ultimate™, eMax™, and BruxZir™. The monolithic zirconia material samples (BruxZir™, Lava Plus™, DenZir™) showed significant intergroup variation both qualitatively and quantitatively.

The two-body in-vitro wear analysis showed that the acrylic antagonist cusp had a clear wear facet for each test group. Results showed that the nano-ceramic composite resin material was more abrasive to the acrylic antagonist material than the other materials tested.

Declaration

This work contains no material which has been accepted for the award of any other degree in any other tertiary institution, and to the best of my knowledge and belief contains no material previously published or written by another person, except where due reference has been made in the text.

I give consent to this copy of my thesis when deposited in the University library, being made available for loan and photocopying, subject to the provisions of the relevant Copyright Act.

I give permission for the digital version of my thesis to be made available on the web, via the university's digital research repository, the library catalogue, the Australasian Digital Thesis Program (ADTP) and also through the web search engines, unless permission has been granted by the university to restrict access for a period of time.

Acknowledgements

I take this opportunity to express my thanks to many people who have provided their assistance in the production of this report and throughout my time at the School of Dentistry, The University of Adelaide.

I would like to sincerely thank my supervisors Professor Lindsay Richards and Dr Thomas Berekally for their continued advice and support. I greatly appreciate having the opportunity to benefit from their knowledge and experience in the field.

I would also like to thank the staff at Adelaide Microscopy and the research staff of the School of Dentistry, The University of Adelaide.

Finally, I would like to thank those close to me, without whom this would not have been possible. Thank-you to my wife Hayley and son Ari for your love and support. Thank-you to my father John, mother Suzanne, and sisters Jolene and Chanelle for your continued encouragement. To my grandmother Joan and my pop Joel, thank-you for your guidance over the years.
