South Australia**

Abstract

The clinically relevant human pathogen *Staphylococcus aureus* employs an energy coupling factor (ECF) transporter to import the important micronutrient biotin. Like the well characterised ABC transporters, the ECF transporters utilise the hydrolysis of ATP to move substrates across biological membranes. However, the ECF transporters do not use a solute-binding protein to bind substrate instead employing a membrane embedded protein to fulfil this role. In certain bacteria, the substrate binding protein required for binding biotin is known as BioY. The aim of this thesis was to investigate protein structure and function relationships involving the BioY protein from *S. aureus* (SaBioY).

S. aureus has functional import and export processes that result in a biphasic profile of biotin uptake. Active translocation of biotin was temperature-dependent, optimum at 30 minutes, and inhibited by biotin or structural analogues of the vitamin. The study demonstrated that recombinant SaBioY could be expressed in *E. coli*, and was localised to the membrane fraction as observed by Western blot analysis on fractionated cell lysates and fluorescence microscopy. Importantly, a convenient ligand binding assay was developed that facilitated deeper analysis of the SaBioY structure and function.

SaBioY primarily recognises the ureido ring of biotin for substrate capture, but an intact thiophene ring also aids binding. Although a variety of functional groups can be appended onto the carboxyl group of the biotin moiety, the linker used to connect the molecules and the chemical property of functional group can impact binding to SaBioY.

This knowledge can be exploited for developing biotin-based analogues with applications in antibiotic drug discovery.

Since an X-crystal structure of SaBioY is not available, membrane topology predictions and computational modelling were used to generate a molecular module of SaBioY. This yielded a model containing 5 transmembrane domains, 3 extracellular loops, and 1 intracellular loop with intracellular N- and C-termini. Whilst the model was in good agreement with known crystal structures of other known S components, it possessed an additional V-shaped membrane embedded helix. Conserved amino acid residues in BioY were identified using the web-based Clustal-W alignment program and then mapped onto the SaBioY model. A series of 24 SaBioY mutants were then generated using random and site-directed mutagenesis approaches. Fluorescence polarisation based competitive-binding assays using a fluorescent-biotin tracer revealed several conserved (R75, D157 and K160) and non-conserved (N38, T54, F81, F88 and D128) residues important for biotin binding. Interestingly, a double mutant D157K/K160E completely abolished biotin binding. A filter disk diffusion assay using a panel of antibiotics showed recombinant expression of SaBioY increased *E. coli* antibiotic sensitivity to streptomycin, erythromycin and chloramphenicol, probably by forming a pore through channel by dimerisation requiring a dynamic cooperative interaction. Expression of all of the SaBioY mutants increased sensitivity to the three antibiotics. The D157K/K160E double mutant was an exception, as it had no effect upon antibiotic sensitivity. We proposed that D157 and K160 together play an essential role in SaBioY activity.

In conclusion, this study successfully characterised the SaBioY transporter in both its native state and using a recombinant *E. coli* expression system. Substrate specificity of the transporter was determined, as was the channel gating potency of SaBioY for certain antibiotics when expressed in *E. coli*. Computational modelling and a novel FP based competitive assay also provided useful tools for biochemical analysis of SaBioY structure and function relationships. Further studies are now required to determine the SaBioY X-ray crystal structure, transport mechanism and regulation as well as to explore possible application of the transporter as a novel drug target or an alternative gating system new antibiotic agents.

Statement of Originality

I certify that this work contains no material which has been accepted for the award of any other degree or diploma in any university or other tertiary institution in my name and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text. In addition, I certify that no part of this work will, in the future, be used in a submission in my name, for any other degree or diploma in any university or other tertiary institution without the prior approval of the University of Adelaide and where applicable, any partner institution responsible for the joint-award of this degree.

I give consent to this copy of my thesis, when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act 1968.

I also give permission for the digital version of my thesis to be made available on the web, via the University's digital research repository, the Library catalogue and also through web search engines, unless permission has been granted by the University to restrict access for a period of time.

Acknowledgement

I would like to use this opportunity to express my deepest gratitude and appreciation to all wonderful people who are directly and indirectly involve in the completion of this study.

I would like to thank my supervisors, Assoc. Prof. Grant Booker and Dr. Steven Polyak, for giving me an opportunity to involve in this research. Your constant guidance, priceless advice, and dedication throughout my candidature have all been greatly appreciated.

Thanks also to Prof. John Wallace, Assoc. Prof. Renato Morona and Dr. Chris McDevitt who were always ready to share their knowledge and experience. Thanks to Dr. Keith Shearwin and Dr. Kate Wegener for the helpful discussion and valuable advice on matters regarding to protein expression and experimental design, to Dr. Ian Muchland for the valuable assistance in cell transformation, and to Dr. Elizabeth Tran for the helpful guidance and training on the microscopy technique.

To the past and present of Booker lab members, namely Ethan, Lungisa, Tatiana, Shee Chee, Wanisa, Weiwei, Ashleigh and Jiulia. Thank you for your helpful advice during my candidature and for making this such interesting journey for me. Special thanks to Wanisa for your help in preparing paper work when I was away, and Weiwei for your help in antibiotic testing experiments. My special acknowledgement to Anna Wiridja, Paul Baker and Euranee for your kind support in creating random and site directed mutagenesis as well as performing competitive binding assay.

I also like to acknowledge the Government of Aceh Province, Syiah Kuala University and the Government of Republic of Indonesia for giving me this great opportunity. Without their funding and support and it will be impossible for me to further my study here in Adelaide.

My father and mother, thank you very much for your unceasing love and care that has shaped me to be the person I am today. Not forgetting special thanks to my family Al Amran, Sri Sundari, Sri Eydia Suri, Mustafa Siregar, Nurjannah Dj., Welldany, Yasir, Andi, and Aidil for your support and encouragement. My words are not enough to express my gratitude and appreciation to what you all have given to me. I also would like to thank all my relatives, friends, and those I have failed to mention here, for their support and understanding.

Finally, I wish to dedicate this work to my wife Nurhayati Siregar and my children Ghina, Luthi and Yasmin, my reason for study so hard. Thank you very much with all the support, love, understanding and patience during this hard journey.
