Abstract

Induction of labour (IOL) is one of the most commonly performed obstetric procedures. Many women undergoing IOL require cervical priming. Most Australian hospitals have an inpatient procedure for cervical priming, which involves pre-labour overnight hospital admission and separation from family and support companions. An alternative is for women to undergo the overnight ripening process in their own homes (outpatient setting). The outpatient setting for IOL has been associated with lower health care costs, reduced length of hospital stays, improved psychological outcomes for women, and overall improvement in women’s experience of the procedure. The aim of the current study was to examine predictors of women’s psychosocial outcomes of outpatient priming for IOL. The current investigation utilised data collected as part of a randomised controlled trial at two South Australian hospitals. Three-hundred and seven women completed a questionnaire seven weeks after giving birth to measure postnatal depression, infant feeding practices, psychosocial experiences of IOL in the outpatient setting, and demographic information. Several consistent findings emerged during data analysis. Women’s reported experiences of safety regarding priming for IOL in the outpatient setting was a significant psychosocial predictor of both postnatal depression and infant feeding practices. Further, women’s linguistic background emerged as a consistent finding, demonstrating a statistically significant relationship with numerous psychosocial experiences, including social support, self-efficacy, readiness, control, information, and safety. The current study offers psychological insight into the outpatient experience of IOL and has clear implications for the advancement of outpatient obstetric care.

Acknowledgements

Foremost I would like to express my sincere gratitude to my supervisors, Professor Deborah Turnbull and Dr Chris Wilkinson. Thank you both for your support in helping me develop my understanding of the role psychology plays in maternity care. As a result, this project has allowed me to combine my passions for maternity care and psychology. Deb your enthusiasm, motivation, ongoing support and guidance have been invaluable. Your generosity of time and wisdom has greatly contributed to both my personal and academic development. I feel privileged and deeply grateful for the opportunity I have had to work with you.

I would also like to thank Dr Amy Salter from the School of Public Health for her statistical expertise and assistance. Amy, your knowledge, support and encouragement have been invaluable especially during the final stages of this project. To the Psychology Honours cohort of 2016, you are a wonderful and inspirational team, thank you all for your friendship and support throughout the year.

Finally, I would like to thank my partner, family and friends, for their unwavering love, encouragement and support and for allowing me to be immersed in my research and also provide me with opportunities to escape it.
