Abstract

Research has identified a wide range of benefits associated with resilience (i.e., the ability to effectively adapt to adversity) and savoring positive experiences (i.e., the capacity to enhance and actively manage positive emotions). However, research on these constructs particularly among older adults is limited. Smith and Hollinger-Smith (2015) found that resilience moderated the relationship between savoring and the affective constructs of happiness and depression. However, no significant moderation effect on the cognitive construct of satisfaction with life was found possibly due to the type of measure used. Furthermore, other aspects of subjective well-being that reflect social relationships were not examined. The current study investigated whether resilience moderated the relationship between savouring and three variables of subjective well-being, specifically, satisfaction with life, satisfaction with social relationships, and perceived quality of social relationships in older adults. Moreover, exploratory analyses were conducted to identify whether particular facets of resilience and savoring were more strongly related to older adults’ subjective well-being. Community-dwelling adults aged 60 and above (N = 412) completed a survey which included five standardised measures assessing savoring, resilience, and the three variables of subjective well-being. The main finding of this study is that resilience moderated the relationship between savoring and satisfaction with life, and this relationship was stronger for older adults with lower resilience. This has implications for the implementation of savoring strategies targeted specifically at older adults lower on resilience as developing a greater ability to savor may enhance the psychosocial resources that they lack and thus improve subjective well-being.
Acknowledgements

I would like to take this opportunity to thank my supervisor, Dr Lynn Ward, for her generous guidance and support throughout the year. Her encouragements and feedback have been invaluable. I am very grateful for having been given the privilege of working with her.

I wish to express my sincere gratitude to the organisations and family members who assisted in promoting my project. I am also very thankful to all the individuals who took the time to participate in my research study.

Finally, I would like to thank my family and friends for their ongoing moral support and for always keeping me motivated. I will always be appreciative of these special people in my life.
