A thesis submitted for the degree of Doctor of Philosophy at the

School of Mechanical Engineering
The University of Adelaide
Australia

Submitted: December 2015
Accepted: March 2016
Abstract

Theoretical, numerical and experimental studies involving elastic plate components, weakened by through-the-thickness cracks and subjected to loading parallel to the plane of the plate, are often based on plane stress or plane strain simplifications. These simplifications essentially reduce the dimensionality of the physical three-dimensional problem and enable the achievement of effective analytical and numerical solutions for many important practical problems. The influence of various three-dimensional effects, such as the variation of stresses across the plate thickness, effects of the three-dimensional corner (vertex) singularities and coupling of fracture modes II and III, on the deformation and stresses near the crack front are at present largely ignored or viewed as negligible for all practical purposes. As a result of this view, the outcomes of experimental studies and fracture tests are also commonly analysed within the framework of the plane theories of elasticity. Nevertheless, a number of theoretical and experimental studies over the past two decades have demonstrated that the predictions made within these theories can be unsatisfactory and the effect of three-dimensional stress states at the crack front on deformation, fatigue and fracture of plate components can be significant.

This thesis aims to elucidate the role of three-dimensional stress states in the deformation, fracture and fatigue phenomena further. The main outcomes of this thesis are: (1) the development and validation of a simplified method for the evaluation of the fatigue crack front shapes and their effect on the steady-state fatigue crack growth rates in plate components; (2) investigation of the effect of three-dimensional corner (vertex) singularities on the stress intensities and displacement field near the crack front; and (3) development and validation of a new experimental approach for the evaluation of mode I and mode II stress intensity factors from the measurement of the out-of-plane displacements in the near crack tip region, which are affected by three-dimensional effects, and, in particular, by the 3D corner (vertex) singularity.
This new research is important in many engineering contexts. For example, the new theoretical model, which takes into account the actual shape of the crack front, can be utilised in advanced fatigue life calculations, as well as in failure investigations. The latter is possible as the shape of the fatigue crack front can now be related to the parameters of fatigue loading. The new experimental approach developed in this thesis can be useful in fracture characterisation of thick plate components with through-cracks. This approach specifically addresses the situation when the K-dominance zone, or William’s solution convergence domain, are relatively small. In this case, the data extraction region can be affected by the three-dimensional stress states leading to significant errors in the evaluation of the stress intensity factors when using traditional approaches.

This thesis is presented in the form of a compendium of published papers that are the summation of the research undertaken by the author. The five articles which form the main body of the thesis are united by a common theme, which is the investigation of three-dimensional effects near the crack front on stresses and displacements, fracture and fatigue phenomena. Two appendices are also included; they represent a compilation of the candidate’s publications related to the main topic of the thesis.
Declaration

I certify that this work contains no material which has been accepted for the award of any other degree or diploma in my name, in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text. In addition, I certify that no part of this work will, in the future, be used in a submission in my name, for any other degree or diploma in any university or other tertiary institution without the prior approval of the University of Adelaide and, where applicable, any partner institution responsible for the joint-award of this degree.

I give consent to this copy of my thesis, when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act 1968.

The author acknowledges that copyright of published works contained within this thesis resides with the copyright holder(s) of those works.

I also give permission for the digital version of my thesis to be made available on the web, via the University’s digital research repository, the Library Search and also through web search engines, unless permission has been granted by the University to restrict access for a period of time.

Acknowledgments

This thesis has become a reality with the kind support and help of many individuals. Here I would like to extend my sincere thanks to all of them.

Foremost, I would like to express my deepest gratitude to my supervisors, Professor Andrei Kotousov, Dr Giang Nguyen and Dr Francis Rose, for their expert guidance, care and patience, providing me with an excellent atmosphere in which to conduct research. In addition, I express my appreciation to Professor Filippo Berto, who was always willing to guide me with my academic research and paper writing. His thoughtful comments are valued greatly. Special thanks go to Mr Andrea Fanciulli for his assistance with my experimental study. It would have been a lonely lab without him.

My sincere thanks also go to Professor Reza Ghomashchi, Professor Ricardo Branco, Dr John Codrington, Dr Erwin Gamboa, Mr Garry Clarke, Miss Alison-Jane Hunter and Ms Fei Gao for providing me with encouragement and support in many aspects of my work.

I thank my postgraduate friends, Aditya Khanna, Munawwar Mohabuth, Houman Alipooramirabad, Pouria Aryan and Sunly Bun for their inspiration and insightful discussions, which provided much stress relief throughout the day.

Last but not the least, I would like to thank my grandmother, aunt and parents for their unconditional love and support throughout my life.
