TRANSPORT PHENOMENA IN VISCOS FLOW
AND
PARTICLE MOTION IN FLUIDIZED BEDS

by

WILLIAM JAMES MITCHELL, B.E. (Hons.)

A dissertation submitted in fulfillment of the requirements
for the degree of Master of Engineering Science
in the University of Adelaide

September, 1988

awarded 20.2.90

Department of Chemical Engineering
The University of Adelaide
Adelaide, S.A. 5001
Australia
DECLARATION

This thesis contains no material which has been accepted for the award of any other degree or diploma in any University and, to the best of the author's knowledge and belief, the thesis contains no material previously published or written by another person, except where due reference is made in the text or where common knowledge is assumed.

The author consents to the thesis being made available for photocopying and loan if accepted for the award of the degree.

W.J. Mitchell
ACKNOWLEDGEMENTS

I would like to thank the following people and organizations for their help in this work:

- my supervisor, Dr. Pradeep Agarwal for his invaluable advice and guidance throughout this study;

- the rest of the academic staff and in particular, Mr. Michael Hounslow, Dr. Ravi Sankar and Dr. David Bogle for their help in parts of this study;

- the Commonwealth of Australia for a postgraduate research award and the University of Adelaide for a tutorship that provided the financial assistance;

- Colin Tipper, Andrew Wright, Peter Kay, Brian Mulcahy and Bruce Ide in the workshop for their assistance with the set up and consequent "debugging" of the experimental apparatus;

- the department secretaries, Mary Barrow and Heather Gordon for always having time to help me when I needed it;

- the other post-graduate students for helping me through this ordeal;

- my girlfriend, Sonia Wilson for her encouragement and friendship;

and - finally, my parents, Ann and Bill, for giving me both the opportunity and the confidence to come this far.

ABSTRACT

GENERALIZED INTERPHASE TRANSPORT PHENOMENA IN NEWTONIAN VISCOUS FLOW
- A single viscous drag relationship applicable to both internal flows through conduits of arbitrary cross-section and external flows over axisymmetric bodies has been developed.
- This has led to a generalised expression for the Chilton-Colburn heat/mass transfer factor, and generalised Sherwood/Graetz relationships.
- The model results have been compared with existing Leveque/Levich type solutions with excellent agreement.
- The work has enabled formulation of an analogy between momentum, mass and heat transport for slow flow conditions.

ACTIVE PARTICLE MOTION IN THE EMULSION PHASE OF A FLUIDIZED BED
- An equation of motion for an active, moving particle in liquid and gas fluidised beds (of inert particles) has been developed and solved.
- Comparisons have been made with the literature, and with experiments as part of the present work.
- The study has illustrated the importance of the formation of a defluidised cap of smaller particles on the top surface of the larger, active, upward moving particle.
- Necessary and sufficient conditions to determine whether an active particle will float or mix in particulate or bubbling fluidised beds have also been developed.
