A Thesis submitted as the Requirement for the Degree of Doctor of Philosophy

August, 1996
ABSTRACT

For a manufacturing company to become world competitive, it must, among other things, have an effective information processing capability. In today’s environment, where there are a great variety of computer systems which an even greater variety of standards, the linking of computers to enable electronic data interchange is difficult and costly. This problem is addressed in this thesis with the development of a Generic, Non-standard Specific Information Flow System which enables computer users to select data which is to be shared in a company and store it in a common database from which it can be accessed by anyone in the company. The information in the common database is stored in a neutral format and the translation to and from this neutral format is done in the background by a Generic Format Translator, which has also been developed as part of this project. It is proposed that the information in the database is carefully selected to minimize memory requirements and speed up access time. A Generic Database Management System has been developed to control the data storage and retrieval processes. Trials of this package in industry have demonstrated that it is workable, cost effective and user-friendly.
# TABLE OF CONTENTS

1. INTRODUCTION .............................................................................................................. 1
   1.1 MRP-II and CAD ........................................................................................................ 1
   1.2 Generic Link ................................................................................................................. 3
       1.2.1 Ways to Achieve Linking of Systems .................................................................. 3
       1.2.2 Linking of Groups of Systems ........................................................................... 5
   1.3 Traditional Way to Achieve Information Exchange ................................................. 8
   1.4 Generic Non Standard-specific Information Flow System ....................................... 9
       1.4.1 Features of a Generic Non Standard-specific System .................................... 10
           1.4.1.1 Independence of number and types of computer systems ....................... 11
           1.4.1.2 Ability to handle various computing operating systems ......................... 11
           1.4.1.3 Ability to handle alphanumeric data items ............................................. 11
   1.5 Objectives of Research .............................................................................................. 12
   1.6 Summary of Contents of Thesis ................................................................................. 12

2. LITERATURE REVIEW ..................................................................................................... 15
   2.1 Protocols and Communication Links ......................................................................... 15
   2.2 Needs for Standardisation of Communication Protocols ......................................... 17
   2.3 MAP/TOP - Their Roles in CIM .............................................................................. 19
2.4 Networking Technology ........................................... 21
2.5 File Transfer Programs .......................................... 22
2.6 Standards Used in Design Area ............................... 23
2.7 Established Format Standards ................................. 24
   2.7.1 STEP (ISO-10303) ........................................ 26
   2.7.2 Review on Format Standards .............................. 27
2.8 Database Management System ................................ 30
   2.8.1 Various Types of Data Models ......................... 31
2.9 Data Exchange Among Computer Packages ................. 34
2.10 Database Formats .............................................. 37
2.11 Summary ....................................................... 39

3. SPECIFIC LINKS .................................................. 41
3.1 Introduction ..................................................... 41
3.2 AutoCAD to IMPCON .......................................... 42
   3.2.1 Data to be Transferred Between the Two Systems .... 43
   3.2.2 Procedures for the Transfer of Design BOM .......... 44
   3.2.3 Programs for Data Transfer ............................. 45
   3.2.4 Procedures of Using the Programs .................... 46
   3.2.5 Communication Software ............................... 48
3.3 Data Exchange in a Full CIM System ....................... 48
3.4 Information Flow System for Specific Linking of Systems 52
3.5 Communication Link Components ............................. 53

3.5.1 Communication Links for the Formation
of a Full CIM System ........................................... 54

3.6 Summary ................................................................ 55

4. GENERIC LINKS ......................................................... 57

4.1 Introduction ............................................................ 57

4.2 Generic Link of CAD and MRP-II Systems ................. 57

4.2.1 Neutral Data File ................................................ 58

4.2.2 CAD Systems ..................................................... 61

4.2.3 MRP-II Systems .................................................. 64

4.2.4 Establishment of Generic Link between CAD & MRP-II Systems ....................................................... 65

4.2.5 Generic Link of Systems to Form a Complete CIM .......... 66

4.3 Proposed Generic Non Standard-specific Information

Flow System (GNSIFS) .................................................. 69

4.3.1 Specification of Input and Output Information ............. 71

4.4 Generic Data Extraction System .................................... 74

4.4.1 Types of Files Used in Data Extraction Process ............. 76

4.4.2 Logical Sequence of Data Extraction Process .............. 76

4.4.2.1 Identify Data in System Datafiles ......................... 76

4.4.2.1.1 Variable Reference Text ................................. 81

4.4.2.2 Record Data Extraction Information in DEI File ...... 84

4.4.2.3 Specify Files for Data Extraction Process ............... 885
4.4.2.4 Extract Data Using DEI File ........................................ 90

4.4.2.5 Put the Extracted Data in Component-related Datafile ........................................ 91

4.4.3 Methodology of Generic Data Extraction ........................................ 92

4.5 Generic Database Management System ........................................ 99

4.5.1 DataBase Management System (DBMS) ........................................ 99

4.5.2 Methodology for Developing RDBMS for Group A Data ........................................ 102

4.5.3 Concept of Flexible DataBase Management System ........................................ 103

4.5.4 Methodology for Developing a FDBMS ........................................ 104

4.5.4.1 Create Component-related Datafile in Common

Database ........................................ 105

4.5.4.2 Store/Retrieve Data from Datafile ........................................ 108

4.6 Generic Format Translator ........................................ 111

4.6.1 Types of Data Formats ........................................ 111

4.6.2 Functions of GFT ........................................ 112

4.6.2.1 Automatic Conversion to Neutral Format ........................................ 112

4.6.2.2 Conversion of Data to System Format ........................................ 114

4.6.3 Methodology for Creating Generic Format Translator ........................................ 115

4.6.3.1 Creating Automatic Translator to Neutral Format ........................................ 116

4.6.4 Methodology for Creating User-defined Format Translator ........................................ 118

4.7 Summary ........................................ 120
5. GENFLOW - THE APPLICATION PROGRAM .......................... 122

5.1 Introduction ........................................................................ 122

5.2 General Description of GenFlow ........................................ 123

5.3 Steps in Using GenFlow .................................................... 125

5.3.1 Login ............................................................................. 125

5.3.2 Data Group .................................................................... 126

5.3.3 Data Transfer ................................................................. 127

5.3.3.1 Data Identification .................................................... 128

5.3.3.2 Data Extraction ......................................................... 131

5.3.4 Format Translator .......................................................... 132

5.3.5 External Program .......................................................... 134

5.3.6 Browser ......................................................................... 136

5.3.7 Help .............................................................................. 138

5.3.7.1 Table of Contents ...................................................... 139

5.3.7.2 General Windows Help Features ............................... 141

5.4 Summary .......................................................................... 142

6. TEST RESULTS AND DISCUSSIONS ................................. 143

6.1 Introduction ...................................................................... 143

6.2 Evaluation of GenFlow in SACFM .................................... 143

6.2.1 Aims of GenFlow Evaluation in SACFM ....................... 143

6.2.2 Procedure ..................................................................... 145

6.2.3 Results of GenFlow Evaluation at SACFM .................... 150
6.3 Evaluation of GenFlow in N.S. Architects ......................... 151
6.3.1 Aims of GenFlow Evaluation in N.S. Architects .......... 152
6.3.2 Method of GenFlow Evaluation in N.S. Architects .... 153
6.3.3 Results of GenFlow Evaluation in N.S. Architects ... 155

6.4 Using of GenFlow at Gerard Industries ....................... 157
6.4.1 Quality Problems at Gerard Industries ................. 158
6.4.2 Three Stages of Implementation for Quality Improvements .. 158
6.4.3 Procedures for Implementing Stage One ................. 159
6.4.4 Feedback for Using GenFlow at Gerard Industries .... 160

6.5 Cost Savings in Developing Conversion Programs ........... 161

6.6 Summary and Discussions ........................................ 163

7. CONCLUSIONS AND FURTHER RESEARCH ....................... 166

7.1 Conclusions .......................................................... 166

7.1.1 The Neutral Format is an Essential Element of Efficient
and Economical Data Exchange ....................................... 166

7.1.2 The Source Files for All Data Must be Available in ASCII for
GNSIFS to Work ......................................................... 167

7.1.3 The Generic Non Standard-specific Concept is Viable .... 167

7.1.4 Minimal Additional Programming is Required ............ 167

7.1.5 Improve Productivity through Better Information Control .. 168

7.1.6 No Special Computer Skill needed to Use the System ...... 168

7.2 Further Research ..................................................... 168
8. REFERENCES ........................................................................................................ 170
