CONTENTS

SUMMARY	i
SIGNED STATEMENT	ii
ACKNOWLEDGEMENTS	iii
CHAPTER 1 INTRODUCTION	
CHAPTER 2 ONE-DIMENSIONAL ELASTIC DEFORMATIONS	
2.1 Introduction	5
2.2 Basic equations	6
2.3 Waves in inhomogeneous rods	7
2.4 Perturbation method	12
2.5 Floquet waves in inhomogeneous periodic materials	16
CHAPTER 3 AXIALLY SYMMETRIC DEFORMATIONS	
3.1 Introduction	28
3.2 Basic equations	28
3.3 General solution using the separation of variables method	30
3.4 General solution using the Laplace transformation	32
3.5 Double walled thick cylinder	36
3.6 Numerical solutions	41
CHAPTER 4 SPHERICALLY SYMMETRIC DEFORMATIONS	
4.1 Introduction	53
4.2 Basic equations	54

4.3 Some simple solutions for homogeneous materials	54
4.3.1 Homogeneous spheres	54
4.3.2 Spherical shells	55
4.3.3 Spheres with two layered materials	56
4.3.4 Two layered spherical shells	57
4.4 Simple solutions for inhomogeneous materials	58
4.4.1 Bessel differential equations	58
4.4.2 Some numerical results	60
4.5 Analytic solution for the time dependent problem	65

CHAPTER 5 ANTI-PLANE DEFORMATIONS FOR ISOTROPIC
MATERIALS

5.1 Introduction	67
5.2 Basic equations	68
5.3 Analytical solution by the method of separation of variables	69
5.4 Boundary element method for static case	71
5.4.1 General solution in term of an arbitrary harmonic function	71
5.4.2 Boundary integral equation	74
5.4.3 Integral equation for interior points	76
5.4.4 Numerical examples	77
5.5 Boundary element method for dynamic case	83
5.5.1 Boundary integral equation	85
5.5.2 Numerical technique	86
5.5.3 Another shear moduli	87
5.5.4 Numerical examples	88

5.6 Boundary element method and perturbation technique	93
5.6.1 Perturbation technique	93
5.6.2 Boundary element method	94
5.6.3 Numerical results	95
5.7 Further technique for the dynamic case	99
5.7.1 General solution	99
5.7.2 Boundary integral equation	100
5.7.3 Numerical results	101

CHAPTER 6 ANTI-PLANE DEFORMATIONS FOR ANISOTROPIC
MATERIALS

6.1 Introduction	105
6.2 Basic equations	105
6.3 Boundary element method for static case	106
6.3.1 General analytical solution	106
6.3.2 Boundary integral equation	109
6.3.3 Numerical approximations	111
6.3.4 Numerical example	114
6.4 Boundary element method for dynamic case	120
6.4.1 General analytical solution	120
6.4.2 Integral equation	121
6.4.3 Numerical example	123
6.4.4 Two inhomogeneous anisotropic materials	124
6.4.5 Numerical example	129

CHAPTER 7 PLANE DEFORMATIONS

7.1 Introduction	133
7.2 Governing differential equation and the fundamental singular solution	134
7.3 General second order elliptic system for anisotropic media and the fundamental singular solution	136
7.4 Boundary integral equation	137
7.4.1 Perturbation technique	137
7.4.2 Two homogeneous materials	142
7.5 Numerical methods	145
7.5.1 Perturbation technique	145
7.5.2 Two homogeneous materials	147
7.6 Numerical results	149
 CHAPTER 8 SURFACE EFFECTS DUE TO INCIDENT PLANE SH WAVES	
8.1 Introduction	158
8.2 Ground motion on an alluvial inhomogeneous anisotropic valley . . .	159
8.2.1 Problem formulation	159
8.2.2 Integral equation	162
8.2.3 Numerical results	165
8.3 Ground motion effect due to subterranean alluvial deposits	170
8.3.1 Problem formulation and integral equation	170
8.3.2 Numerical results	171
 APPENDIX A	 175
 APPENDIX B	 177

SUMMARY

Two types of inhomogeneous elastic materials are considered in this thesis. The first type of material is made up of different regions with the elastic coefficients constant in each region. For the second type of material the elastic coefficients vary continuously with the spatial coordinates.

The thesis may be thought of as being composed of three parts. In the first part, the one-dimensional propagation of waves through an inhomogeneous elastic material is considered. Numerical solutions for certain materials are obtained by using the finite difference method. In the second part of the thesis, axially symmetric and spherically symmetric deformations problems of inhomogeneous materials are considered by employing analytical techniques. In the final and major part of the thesis, we consider some antiplane and plane deformation problems for isotropic and anisotropic inhomogeneous elastic materials. In the antiplane and plane problems emphasis is placed on the development of the boundary element method for the numerical solution of particular boundary value problems. The kernel of the integral equation for some specific materials is derived so that the standard boundary element method may be employed.
