Summary

In the pig and poultry production industries, energy forms the largest and the greatest cost pressure when a diet is formulated. In Australia, cereal grains such as barley, sorghum, and wheat are the main dietary energy sources, comprising more than 60% of the diet in many cases. Traditionally, during diet formulation, the energy value of a grain has been represented by a single figure for that particular grain type. However, several studies have indicated that the energy availability from different grains fed to pigs and poultry varies significantly even within one grain cultivar. Given these findings, the use of a single value to represent the energy of each grain type during diet formulation, can lead to inefficient utilization of dietary resources by animals, and thus decreased animal performance and consequently, a decrease in profit for the pig and poultry production industries.

Thus, there is an opportunity to develop a rapid and reproducible in vitro assay to accurately assess the available energy values and nutritional quality of each grain type. In order to develop such an assay, further understanding of factors that affect the available energy values of grains need to be explored.

Starch, which is hydrolysed into glucose by animals, is the most abundant energy component in cereal grains, and there is evidence suggesting that variations in digestible or metabolisable energy values may be related to the extent of starch digestibility. For example in poultry, variations in the in vitro digestibility of starch between several wheat cultivars have been shown to correlate with their in vivo available metabolisable energy values. However, it is not known to what extent starch digestibility varies between cultivars of other grain types such as barley and sorghum.

There is an increasing body of evidence suggesting that differences in the physical and chemical properties of cereal grains may play an important role in influencing starch digestibility and, consequently, animal performance. Thus, the general hypothesis of this study was that starch digestibility varies between barley, sorghum and wheat, and between cultivars within grain types and this is related to specific chemical and physical characteristics of the grains. To examine this, the following issues were investigated using 18 barley, 15 sorghum and 10 wheat cultivars: 1) an in vitro glucose release index (GRI) assay was developed to assess starch digestibility within and between the cereal grain types and, 2) the GRI was correlated to both starch-related (e.g., starch content, starch granule size, the amylose to amylopectin ratio, starch gelatinisation properties) and non-starch-related (e.g., non-starch polysaccharide composition, kernel hardness) the presence of
protein matrix and milling quality) physical/chemical characteristics within and between the cereal grains.

Results revealed significant variations in the GRI both between grains and within a given grain type. The GRI values ranged between 27 - 45%, 25 - 54% and 32 - 53% in barley, sorghum and wheat respectively. Correlation analysis revealed that the GRI in barley, sorghum and wheat was influenced by the physical and chemical characteristics of starch- and non-starch-related grain properties, although the type of characteristic influencing GRI was specific to the grain type. In barley, the ratio of amyllose to amylopectin, starch gelatinisation and kernel hardness influenced the GRI. In sorghum, the GRI was influenced by the ratio of amyllose to amylopectin, the presence of a protein matrix surrounding starch granules and kernel hardness. Finally in wheat, the presence of protein matrix and milling quality influenced the GRI. It was also shown that the extract viscosity of grains within barley and wheat, but not sorghum, varied significantly.

In conclusion, this study 1) indicated that the GRI may be influenced by some physical and chemical characteristics of cereal grains, and that these characteristics are specific to the type of grain, and 2) identified that future work should establish the relationship between GRI in vivo starch digestion and absorption of cereal grains.

The physical and chemical characteristics that may influence starch digestion are discussed in relation to their potential physiological effects on energy digestion, and utilisation in animals. The information generated will provide a basis for future studies that will ultimately assist in the design of in vitro assays to predict energy availability from barley, sorghum and wheat grains fed to pigs and poultry, and contribute to the more efficient use of grains in monogastric production systems.
Declaration

This work contains no material which has been accepted for the award of any other degree or diploma in any University or other Tertiary Institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text.

I give consent for this copy of my thesis, when deposited in the University Library, to being available for loan and photocopying.

Mohammad-Reza ZARRINKALAM

Date: 27/11/02
Dedication

This thesis is dedicated to my parents, Mr Hossien Zarrinkalan and Mrs Zahra Zarrindokht Pourjalali for believing in my dreams and giving me encouragement to pursue them.

And to my wife Krystyna, for her love and believing in me.
Acknowledgments

I would like thank God, who has given me the courage to take risks in my life.

The current work could not be achieved without the assistance and guidance of a large number of people. I have been extremely fortunate to have access to an extraordinary team of supervisors during my PhD project and I would like to express my warmest thanks to these people as follows:

Dr David Tivey, Lecturer, The University of Adelaide, who showed me the lateral way of thinking and always gave me confidence by saying “if I can do it, you can too”

Dr Robert van Barneveld, Barneveld Nutrition, and supervisor of the subprogram No.3 “Rapid and Objective Analytical Tests” of the Premium Grains for Livestock Program, who showed me determination through his “just do it!” comments and that the sky is the limit.

Dr Dean Revell, Senior Lecturer, The University of Adelaide, and Associate Professor Mingan Choct, Lecturer, New England University, who taught me the scientific way of thinking and writing and for always being there for me.

Dr John Black, John Black Consulting, who encouraged me to look beyond my boundary “seeing the bigger picture”.

I would also like to show gratitude to Australian Pork Limited (APL) for their financial support and to the GRDC both for their financial support and allowing me to use their data for my PhD project. Many thank go to Ms Michelle Lorimer for her assistance in statistical analysis and Mrs Margaret Cargill for her kind help in editing my literature review. My thanks also go to Ms Helen Colin and Dr Meredith Woodwork for their assistance in the microscopy work. I would also like to thank the people in CEMMSA and the School of Rural Sciences and Agriculture at the University of New England, for their assistance in my experiments. Thank you to Aventis Co. and the SARDI grain quality laboratory for generously allowing me to use their facility, equipment and their expertise. I would also like to show gratitude to Australian Pork Limited (APL) for their financial support and to the Grain Research and Development Corporation (GRDC) both for their financial support and allowing me to use their data for my PhD project. To the APL postgraduate group (especially Mr Ben Gursansky and Dr. Mike Taverner) thank you for all your support. I would like to also thank my fellow post-graduate students in the Animal Science Department, for your friendship, especially Mr Bob Hughes (Uncle Bob) for his advice and encouragement during my PhD. My sincere thanks to the people in SARDI and The University of Adelaide, especially the pig and poultry research group, Jurek (Polish
Australian friend), Sharon, Kylee, Stove, Geoff, Derek, Peter, Evelyn, Sandy and Michael for their friendship and support.

I would like to thank my family in Australia and Iran for their immeasurable support during my PhD. Finally I would like to thank my wife, Krystyna, for her editing, love and support that made the difficult times through my PhD journey seem easier.
