--- P R E F A C E ---

This work has been done under the auspices of the Department of Physiology of the University of Adelaide with grants made available by the National Health & Medical Research Council.

The greatest praise must be given to the subject of these experiments, Mrs. H. Bowman, who has undergone considerable pain and discomfort on numerous occasions and at least once has faced definite danger. These trials she has undergone in order to help her son, who is also a sufferer.

The work has been continued under difficulties in finding mutually suitable times for experiment for Mrs. Bowman, Dr. Draper, my collaborator, and myself.

It was decided to divide the work into two sections, Clinical and Experimental. The discussion is an attempt to combine the knowledge obtained from both studies in an effort to understand the complex mechanism of the abnormal muscular contraction.

My thanks are due to many people, and particularly to Dr. M.H. Draper who has assisted me with all the experimental work. The electromyographic section could not have been attempted without his knowledge and enthusiasm. To Mr. Edgar goes the credit of designing and constructing an efficient recording apparatus for this section. This has entailed much reading and experiment, and will be the subject of a further communication by Dr. Draper and Mr. Edgar.

I wish also to thank the following for help and advice in many sections of this work:

Mr. E. J. Breakwell, M.Sc. in the Genetics Section.

Mr. P. Schinckel, B.V.Sc. in the Stringhalt Section.

Mr. Weller for the photographic work.

Mr. Cowan and the Library Staff have saved me many hours in obtaining and checking references.

Finally I must thank Professor Sir Stanton Hicks and members of the Department, particularly Mr. Eldridge and Mr. Braden for their efforts on my behalf.

J. S. COVERNTON.

GAWLER, 2nd July, 1945.
