

**PRESENT-DAY STRESS IN CENTRAL AND SOUTHEAST  
AUSTRALIAN SEDIMENTARY BASINS**

**Emma Jane Nelson, B.Sc. (Hons)**

The University of Adelaide

This thesis is submitted in fulfilment of the  
requirements for the degree of Doctor of Philosophy  
in the Faculty of Science, The University of Adelaide.

January 2007

## Abstract

This thesis consists of six published papers. The present-day stress tensor has been determined using petroleum well data in the Gippsland and Otway Basins in Southeast Australia (Papers 1 and 4) and the Cooper Basin in Central Australia (Paper 5). In the Gippsland Basin, the present-day stress regime is transitional between one of reverse and strike-slip faulting and the maximum horizontal stress ( $S_{Hmax}$ ) is oriented  $\sim 139^\circ N$ . The present-day stress regime in the Victorian sector of the Otway Basin is also transitional between one of reverse and strike-slip faulting and  $S_{Hmax}$  is oriented  $\sim 135^\circ N$ . Horizontal stresses are lower in the South Australian sector of the Otway Basin where the stress regime is one of strike-slip faulting and  $S_{Hmax}$  is oriented  $\sim 124^\circ N$ . The orientations of  $S_{Hmax}$  in Southeast Australia are consistent with focal mechanism solutions, neotectonic structures and modelling of plate-boundary forces (Paper 4).

Closure pressures from mini-frac injection tests are commonly used to determine the minimum horizontal stress ( $S_{hmin}$ ) magnitude. However, in high stress basins such as the Cooper and Gippsland Basins, these pressures may not reliably yield  $S_{hmin}$  (Papers 2 and 5). In the Cooper Basin, high closure pressures ( $>18$  MPa/km) were observed in tests where pressure-declines indicated complex hydraulic fracture growth. Closure pressures in these injections are unlikely to be representative of  $S_{hmin}$ . They are believed to reflect the normal stress incident on pre-existing planes of weakness that are exploited by hydraulic fluid during the mini-frac injection (Paper 5). Sub-horizontal fabrics that are open at the wellbore wall were observed on image logs in the Cooper and Gippsland Basins (Papers 2 and 5). This fabric is believed to be at least partially responsible for the

complex growth of hydraulic fractures observed in the Cooper Basin. The occurrence of these sub-horizontal fabrics and knowledge of rock strength have been used to constrain the magnitudes of  $S_{Hmax}$  and  $S_{hmin}$  independently of mini-frac injections in the Cooper and Gippsland Basins (Papers 2 and 5).

The present-day stress tensor is often quoted as a single gradient at a sedimentary basin- or petroleum field-scale. Image logs and mini-frac data from Central and Southeast Australia indicate significant stress differences between stratigraphic units (Papers 3 and 5). Finite element modelling of the stress distribution between interbedded sands and shales in the Gippsland Basin indicates that stress is 'partitioned' to 'hard' lithological units in high stress areas. This accounts for the observation that borehole breakout only occurs in hard, cemented sandstones in the Gippsland Basin (Paper 3). A generic 'mechanical stratigraphy' derived from knowledge of wellbore failure (from image logs), rock strength and rock properties in individual rock units in the Cooper Basin allows an approximation of the present-day stress-state to be made directly from image-logs for individual rock units prior to mini-frac injection (Paper 6). This is important for predicting and understanding hydraulic fracture growth and containment.

When considered together, the papers comprising this thesis provide significant new data on the orientation and magnitude of present-day stresses in Central and Southeast Australia. They also provide insight into the tectonic origin of those stresses and their distribution within sedimentary basins. In particular the papers develop and use new methods for constraining the present-day stress in regions of high tectonic stress. They

also discuss implications for problems in petroleum development including wellbore stability and hydraulic fracturing.

## Table of Contents

<b>Abstract</b> .....	1
<b>Table of Contents</b> .....	4
<b>Declaration</b> .....	6
<b>Statement of Authors’ Contributions</b> .....	7
<b>Acknowledgements</b> .....	14
<b>1. Contextual Statement</b> .....	15
New present-day stress data for Southeast Australia (Papers 1 and 4) .....	16
New methodologies for constraining present-day stress in high stress regions (Papers 2 and 5).....	17
New methods for constraining the present-day stress in lithological units (Papers 3 and 5).....	18
Using present-day stress data to understand wellbore instability in the Gippsland Basin and hydraulic fracture complexity in the Cooper Basin (Papers 3, 5 and 6) .....	19
<b>2. Literature Review</b> .....	21
Determining the present-day stress tensor .....	21
Present-day stress in the Australian Plate .....	31
<b>3. References</b> .....	38
<b>4. Thesis Conclusions</b> .....	44

## **Statement of Authors' Contributions**

The research summarised in the papers that constitute this thesis was undertaken within the 'Stress Group' at the Australian School of Petroleum and with industry collaborators. The ASP 'Stress Group' comprises several PhD students and research staff who collaborate across a broad range of present-day stress-related issues. Hence all the papers presented herein are co-authored and detailed statements of relative contribution are summarised below and endorsed by the co-authors.

NOTE: Statement of authorship appears in the print copy of the thesis held in the University of Adelaide Library.

## Acknowledgements

This thesis and the work undertaken within it could not have been completed without the support and encouragement of many people.

- **My supervisors Richard Hillis and Scott Mildren.** Thanks to you both for your encouragement and technical guidance. Thanks Richard for all the opportunities you opened up, the challenges you provided and the support you gave me meeting them. Thanks Scotty for your calming influence when some of those challenges got the better of me!
- **My unofficial supervisors Simon Chipperfield and Jerry Meyer.** Thanks for letting me bounce ideas around, challenging me and always answering my questions.
- **The sponsors.** Thanks to the ASEG RF and Santos for financial support, and Shell and ExxonMobil for supplying data. Thanks to Gerry Carne, Dave Warner and Thomas Flottman for your support and encouragement throughout my PhD.
- **My friends.** Special thanks to Sam Morris and Mark Reilly for your support, encouragement, keeping me honest and making me have some fun! Thanks also Dan, Helen, Adam, Sasj, Zsolt, Phoebe and the gang at ASP/G&G for making Adelaide a good place to be. Thanks to Maureen for ensuring I was always fed!
- **My family.** Thanks Mum, Dad, Heather, Sarah, Katie, Daniel, Alex and Erin for always supporting and encouraging me. Thanks also to Mum, Dad and especially Sean for keeping the pressure on and encouraging me while I was finishing my paper corrections at BP in London. All of it was tough but the last part was definitely the toughest.
