DECLARATION

I declare that this thesis is a record of original work and contains no material which has been accepted for the award of any other degree or diploma in any university. To the best of my knowledge and belief, this thesis contains no material previously published or written by another person, except where due reference is made in the text.

Preface

This research was performed over 10 months as part of a Masters in Biotechnology (Plant Biotechnology). The literature review was previously assessed. The original research focus has not changed, however due to some unexpected complications in the development and optimisation of an AtAMT1;2 antibody, the last part of proposed research has yet to be completed. Although the research manuscript contained herein will provide the first draft of a future publication in The Plant Journal, the originally intended data set is still incomplete. Additional but incomplete data pertaining to the antibody work and leave confocal microscopy are provided within the appendices.
Table of contents

Declaration..............................................................................................................2

Preface ....................................................................................................................3

Chapter 1-Introduction .............................................................................................7

Chapter 2-Literature analysis....................................................................................8

2.1 The significance of Nitrogen Use Efficiency...................................................8

2.2 Sources of nitrogen for plant consumption.....................................................9

2.2.1 Ammonium....................................................................................................9

2.2.2 Nitrate...........................................................................................................10

2.3 Nitrogen transport and assimilation...............................................................10

2.3.1 Ammonium transport and assimilation.......................................................10

2.3.1.1 Physiological systems of ammonium uptake.............................................10

2.3.1.2 Ammonium assimilation..........................................................................11

2.3.1.3 Enzymes involved in ammonium assimilation...........................................11

2.3.2 Nitrate transport and assimilation...............................................................12

2.3.2.1 Physiological systems of nitrate uptake......................................................12

2.3.2.2 Nitrate assimilation..................................................................................13

2.4 Known ammonium transporter families.........................................................13

2.4.1 AMT.............................................................................................................14

2.4.1.1 Protein structure of AMT1 .......................................................................14

2.4.1.2 Characteristics of AMT1;1.................................................................15

2.4.1.3 Characteristics of AMT1;2......................................................................16

2.4.1.3.1 Regulatory effects of glutamine.........................................................17

2.4.1.3.2 Protein characterization of AMT1;2....................................................17
5. 1.5 Western blot analysis of plant microsomal protein fractions using a purified primary anti-AtAMT1;2 antibody.................................................................69

5. 1.6 Conclusion..............................................................................70

5.2 Confocal microscopy on leaves of the amt1;2 T-DNA (DuPont) and its corresponding parental lines.................................................................71
