amount of scientific knowledge which he has acquired. In all probability when the results were de-

disclosed the world would be astonished. For those who could

decide would be the especial point from the point of view of

society. Even in his youth, Dr. H. W. Mawson, one of the

greatest of the Antarctic explorers, had published a statement that the work already

done by the expedition was far from being done.

The expedition had been in the Southern Hemisphere

for two years, and the results of the exploration of

the Ross Ice Shelf, the Magnetic South Pole, and the

Antarctic Circle had been more than sufficient to justify

the expedition's continued existence. The scientific

results of the expedition had been more than sufficient to

justify the expense of the ship and the crew.

The leaders of the expedition were men of

great character and ability, and their work had

been done in a most scientific manner. The

explorers had been constantly in touch with

the laboratory at South Australia, and it was

expected that the results of their work would be

published in the near future.

The expedition had been well supported by the

government, and it was hoped that the results of

the work would be of great value to future

explorers.
