AFFORESTATION.

GOVERNMENT'S NEW PROPOSALS.

SCHOOLS FOR WOULD-BE WOODSMEN.

At the Forestry Conference, which was held coincidentally with the Foresters' Conference last week, the question of provision for the training of foresters in the future was discussed. The conference recognized the need for such provision and recommended that steps be taken to establish a new school for the training of foresters.

New South Wales is actively pursuing this recommendation, and a new scheme is being considered. The scheme aims to provide a thorough training in all aspects of forestry, from the scientific and technical to the practical and economic.

South Australia, on the other hand, has already established a forestry school, and it has been in operation since 1912. The school has produced several successful graduates who are now playing key roles in the forestry industry.

A new scheme is being considered for South Australia, which would involve the establishment of a new school specifically for the training of foresters. This scheme is based on the principle of providing a comprehensive education in all aspects of forestry, from the scientific to the practical.

The conference also discussed the importance of afforestation, and the need for more trees to be planted across the country. The government has committed to increasing the number of trees planted each year, and this has been reflected in the proposals for the new schools.

The government has also recognized the need for more training in forestry, and has committed to establishing new schools to meet this need. The new schools will provide a comprehensive education in all aspects of forestry, from the scientific to the practical, and will be open to all who wish to pursue a career in forestry.

The government has also committed to increasing the number of trees planted each year, and this has been reflected in the proposals for the new schools.

The new schools will provide a comprehensive education in all aspects of forestry, from the scientific to the practical, and will be open to all who wish to pursue a career in forestry.

The government has also committed to increasing the number of trees planted each year, and this has been reflected in the proposals for the new schools.
To attract attention to the subject it must abundantly clear that if we are to satisfy the everlasting demands of the future, for wood for the conservation of our native timber and in the extension of our plantation and recreation grounds, the necessity now prevailing makes it impossible to admit that it is unadvisable in ordinary times. But there is no reason why we should not plan for the future, so that in real emergency conditions, they can be readjusted by more stringent lines than have hitherto been employed.

The Forest Department of South Australia, in spite of the great advantages and superior record of work accomplished at least for the Commonwealth. We have reached a state of development, however, when, in this country and others, we must replant the forests that have been damaged, re-planting in places, where it is necessary to do so, and where the trees have been excessively damaged. In such cases they will have to be replanted with young trees. It is a matter of great importance to the nation that the trees be replanted as soon as possible.

The University of Adelaide, established in 1851, has a body of Assistant Foresters with the qualifications of the first rate in the field of forestry. Of these Assistant Foresters there are 13, with a brilliant record in the cause of forestry. The other four officers are Assistant Foresters, who, since the beginning of the war, have been engaged in the control of the forest fires and the preservation of the forests. The first four years of their service have been spent in the study of forestry, and they have been given an opportunity to study in the field of forestry in the University of Adelaide, and in the field of forestry in the State of South Australia.

The conditions set out in the prospectus were designed to ensure the success of the scheme and to attract the attention of the public to the importance of forestry. The conditions provide for the establishment of a Forestry School at the University of Adelaide, and for the training of students in the field of forestry. The school will be equipped with the latest apparatus and the most modern methods of instruction. The students will be given an opportunity to study the anatomy of the trees, their physiology, their growth, their reproduction, and their response to different conditions. The students will be given an opportunity to study the effects of different conditions on the growth of the trees, and to study the effects of different conditions on the reproduction of the trees. The students will be given an opportunity to study the effects of different conditions on the physiology of the trees, and to study the effects of different conditions on the reproduction of the trees.

The profession of forestry offers a number of advantages to those who are interested in the study of forestry. The work is interesting, healthy, and the general environment is excellent. The work is not only a means of earning a living, but it is a means of enjoying life. The work is not only a means of earning a living, but it is a means of enjoying life. The work is not only a means of earning a living, but it is a means of enjoying life. The work is not only a means of earning a living, but it is a means of enjoying life.
Developing Timber Resources,

A well-considered comprehensive scheme in connection with a large policy in forestry has been put forward by the Acting Commissioner and President of the벌 Forest Lands (Hon. H. J. Vaughan) on Saturday morning. For some time the Minister and the Acting Commissioner have been discussing the question of the development of the forests in the State, and the proposals which have been made are not only designed to make the profession more attractive and to lead to an important development of our timber industry, but also to ensure that the interests of the community in these forests will be safeguarded, as is the case in other countries.

Mr. Vaughan explained that the main object of the scheme was to create a public forest in the vicinity of the city, and to provide for the incorporation of a public body to manage the forest. The scheme also includes the establishment of a school of forestry, which will be under the control of the State.

Serious Shortage

The serious shortage of public forests in the state of Victoria has led to the establishment of a public forest in the vicinity of the city, and it is hoped that a larger scheme will be put forward in the near future. The existing forests are not sufficient to meet the needs of the community, and the scheme is designed to provide a large and adequate reserve of timber.

The scheme also includes the establishment of a school of forestry, which will be under the control of the State. This will enable the students to be trained in the art of forestry, and to make a valuable contribution to the development of the industry. The school will also provide an opportunity for the training of young men who are interested in forestry, and who wish to enter the profession.

The scheme has been welcomed by the community, and is expected to be successful in the near future. The provision of a public forest and the establishment of a school of forestry will be of great benefit to the community, and will provide a valuable source of employment and income.

Resident Foresters

The Forest Department of South Australia has been established, and is now in charge of the Resident Foresters. The department is responsible for the management of the forests, and is charged with the task of maintaining the forests in a sound and healthy condition.

The Department is responsible for the care and protection of the forests, and is also responsible for the management of the timber resources. The Department is also responsible for the training of forest officers, and for the provision of a public forest in the vicinity of the city.

An Attractive Sphere

The forest and woodland areas offer an attractive prospect for the development of a variety of industries. New spheres of activity are opening up and it is likely to be the case that the present is going to be a period of growth and development.

The forest industry has always been an important one and is likely to become more so in the future. There is a great deal of wood available and it can be used for a variety of purposes. At the same time, the demand for forest products is likely to increase.

The timber industry is one of the most important in the country. It is one that is likely to grow in the future and it is likely to become more important as the demand for forest products increases.

The forest industry can be used to provide a range of products. There is a great deal of wood available and it can be used for a variety of purposes. At the same time, the demand for forest products is likely to increase.
