tion of the air within the region of a cyclone was described as a 'siphon' in the form of a spiral whirlwind. The statement that "Australia is the only country in the world where the air is not stagnant" is also noted. It is suggested that this is because of the geographical position and the movement of air masses. However, it is not clear if this is the main focus of the article or if there are other topics being discussed as well.

The article also mentions the importance of oil to the world economy and the potential for Australia to become a major producer. It is noted that the increasing demand for oil has led to a rise in prices and a need for new sources of energy. The article briefly discusses the potential for Australia to become a major producer of oil, but it is not clear how this relates to the main focus of the article.

Overall, the article is somewhat disjointed and seems to cover a variety of topics related to the air and the economy. It is not clear if the main focus is on the air within a cyclone or on the broader topic of the economy and energy sources.
