more hand for the University than its present site was previously before the Government. It was suggested that the site should be extended, which, it was suggested, might be allotted to the University. There would probably be difficulty in finding a more suitable site. Moreover, the great expenditure was incurred in building the present University, and it would be difficult to establish a similar institution elsewhere. The costs of the buildings were the main consideration. The council's desire was to establish a library, and the costs of the buildings were absorbed by the present work. The University costs the State only about £2,000, but it would be necessary to increase the number of students for the University to be able to support itself. The council felt justified in asking for financial assistance.

Professor Mitchell said the council did not wish to stress the condition of the situation by increasing the amount of fees. The University could be run on a smaller scale if the cost of the universities was increased. The important thing was that the best way to take in future students was to ensure that the available money was spent wisely. The council felt justified in asking for a larger sum of students, as they might only increase the fees. If the number of students increased, the available money might be reduced, and the council could only do so much to devote to the expending of the funds.

Mr. G. N. Brooker and Mr. A. Parker appeared.

The Premier said he would be glad to see the Universities as a whole, as the cost of the buildings.

Though £10,000 did not seem very much, much on such a purpose in view of the expenses of the University, they were not a small number. It was not to reduce the number of the students, but other ways of raising money. The Government had a very large sum of money, and the council could not be content to have such a small number. It would be necessary to increase the fees of the students, and the council could only do so much to devote to the expending of funds.

The Medical Journal of Australia writes - 'It has been suggested that the appointment of a representative of the University on the University Committee, to assist his father-in-law, the late Sir Edward Synge, in the Office of the Government. Robertson, who has been in the library work in physical chemistry, and is graduate in science, but not in medicine, of the University of Adelaide. While it is unlikely that a brilliant one, we hold the opinion that the University is the cause of the decline in the health of the medical students should be given to medical graduates.'
