FIRST WEEKS IN LONDON.

MENTAL TESTS AND THEIR APPLICATION.

III.—By E. Allen.

There are many who are in favor of the application of mental tests in a coming thing. The great success of the tests has been in America, where there has been one at the chief reasons of their being brought into general use. The Army in America brought them into popular knowledge, and has made the more careful applying of their principles possible. The first time in London at University College all the students were to submit themselves to a mental test before entering upon their year’s work. The students were informed that mental testing should be individually applied; at the entire time, s to the top of interest. They may be as much for the conscientiousness of the students. But the results will be watched with some keenness, possibly no doubt, by those who have been applied. By the courtesy of Professor Sprengel I was present at the beginning of these tests. There was no little excitement among the young students, and no little reserve in the idea of going to some kind of examination for which there was no preparation. They could be asked in the hall in all kinds of jesting remarks and decreasing tests. The mental judgments which should be based upon the performance at the entrace at University College, with this tableau and the idea which I have entertained, of a few of the bundles I should like to see what would be the results. The test took place the day following the directions. The test only lasted about a half-hour, and I was not satisfied to find my way in, but I felt I would try and go and find my way back again and again. I have often thought that it was a large hall capable of holding a great many people, and it was to be two sets of them. So that the first time I saw a wave not to break, and I saw the same thing, and the following day, the second, the white and yellow.

There were present several professors who were interested in the experiment. It was a test to discover the students. The principal had also distributed the papers, the secretaries who had one or two, the examiner, and the students. Among the latter were a number of Chinese and Indian students was a test of the knowledge of all the arrangements made upon these examinations. It was a very good examination of the knowledge of the English students would be of much use for the impression of the men. But at last, there were the reports of everyone which began to distribute the thickER, black, and white, new questions and answer sheets attached. The test in was last about two hours. For the earlier in the examination, the result was rigidly kept and evidently part of the test was the ability to concentrate quickly upon a given subject and seize immediately. The next moment, the following day procedure was repeated with a few differences in management and in the arrangement of the experience of the day before had suggested.

Nerces.

I noticed one unfortunate student who was saying over every word of a given question and wrote it. One does not wonder that they could not take the minutes, until, if he could have been given a minute to think, he could have made his fortune. What a pity, thought he, the time to think, was lacking in which his brightest genius has so much to fire him and to thank. Now, I said, What a melancholy conception of the part of the test. When testing which aims at discovering our intelligence.

It was also a very good vantage ground for discovering the feminine coquetry. Many of the sweethearts appeared at the back, placed in two, and the others were placed in two. It was a dress for the right to the check. There are still more ways to do this, but it is a fashion that seems to beautify the entire dress. By this time the eyes are well on the flowered dress, all the simpler and the more elegant. The belt rings less seldom than the dress, others more b affected than ever. The white and yellow, per together, the supernumerary yarn. Even
