ASSOCIATION NEWS AND NOTES.

"The Little League of Nations."

A correspondent has asked for further particulars of the All Nations Union movement. The following has been supplied by the Chairman of the committee (Miss E. C. Claxton).—It seems that at the present juncture a better understanding between the nations upon earth is an absolute necessity. The work of the League of Nations is to promote such good fellowship and to make the peoples to pass before plunging headlong into war. The result would be appalling should another war break out, for it would mean nothing short of the destruction of our present civilization.

ELDER CONSERVATORIUM.

FELICITATION OF THE STAFF AND STUDENTS TO MRS. POOLE.

Elder Conservatorium.

MISS MARGARET DARLEY NAYLOR.

Thinking upon these lines, some of us were drawn together to consider means by which the growing generation might be led to feel sympathy and kindliness towards little folk in other climes. The thought of chivalry readily appealed to the child mind and is one of those traits which thoughtful men and women would like to see cultivated. Not developed at the right time, this fine feeling is dispelled.

The hope of the committee is to develop this trait so that the attitude of chivalry may become permanent.

Professor Darley Naylor has consented to become President of the movement, and he will open the proceedings on December 8th. The work so far has been given by a provisional committee.

MEDICAL OPINIONS.

Will do Good

When asked if a meat shortage will have any effect on the public health, Dr. J. B. Robertson, of University of Sydney Faculty of Medicine, said it had been feared that meat might be in short supply, but the shortage of supplies had been largely overcome by the introduction of more efficient methods of processing and distribution.

"Meat," he said, "contains an inorganic element, which takes much longer to undergo a change than organic matter. When meat is condemned by the authorities, it is because it has undergone a change that makes it unsafe for human consumption."

"Australians are the fortunate people in this matter. The average American, Frenchman, or Englishman has no idea of the areas under which meat is subjected. It is possible to raise meat in Australia on a much healthier basis than in the United States, where meat is often raised on free range, which is unsatisfactory in itself."

"As, however, Australians are such fortunate people, it is to be hoped that the medical authorities will realize the need for a more scientific method of processing and distribution of meat, which will make it possible to raise and distribute meat in a way that will be a gain to the public health.

"The triumph of medical science is to be the production of a product that is safe and wholesome, which will give the people a satisfaction that they have a good product to consume."
