ENemies to Health.

The Fly, Rat and Mosquito. Lecture by Sir James Barrett.

The ravages to health caused by the house fly, the rat and the mosquito were graphically illustrated in the lecture given by Sir James Barrett on Saturday evening.

Sir James Barrett lectured at the Lister Hall on Saturday evening on "Flies, Rats, and Mosquitoes." He was introduced by Dr. P. R. Hoge (president of the Health Association of Victoria) and Dr. E. B. Haynes (Honorary Secretary of the Health Association of Victoria). The lecture was illustrated by excellent film, depicting the history of the house fly, the rat and the mosquito, and the havoc they cause to human health, food, and the mosquito. The lecture was graphically illustrated. A humorous film with a moral about the advantages of the house fly and mosquito was also shown.

The main theme of the lecture was to illustrate the destructiveness of flies and mosquitoes, and to show how they spread disease. Sir James Barrett used film clips and diagrams to demonstrate how flies lay eggs on food, and how these eggs hatch into larvae that can cause disease. He also showed how mosquitoes, by sucking blood, can spread diseases such as malaria and yellow fever. The lecture was well received by the audience, and many people expressed interest in learning more about the prevention of diseases caused by flies and mosquitoes.

The lecture concluded with a discussion on the importance of keeping our environment clean and free of pests. Sir James Barrett emphasized the importance of personal hygiene and the role of public health officials in controlling the spread of disease. He encouraged everyone to take responsibility for their own health and to work together to prevent the spread of these harmful insects.

The lecture was well attended, and many people were eager to know more about the health hazards posed by flies and mosquitoes. Sir James Barrett's lecture was a valuable contribution to the understanding of the role these pests play in the spread of disease.
