VIEW OF PART OF THE ESTATE—EACH PLOT CONTAINS A GRASS OF A DIFFERENT VARIETY

The same class of work is also conducted at the Kybbolite farm, near Nowra, where the water supply of the farm is used for irrigation. A good deal of work has been done with the best type of land for this purpose.

Kkybolite Farm

Kybbolite is situated in the South, and consists of about 700 acres of land surrounding the old Kybbolite sheep station, and is the home of a着手 of different breeds of cattle. The work in the irrigation is carried out with a view to testing the effectiveness of some of the irrigated crops. In connection with this, various methods have proved valuable. Small amounts of manure are also used in proportions seen.

Valuable Work at Berri

The experiments at Berri have been conducted by Mr. G. Quinn (Horticultural Expert), who has experimented with a large number of different crops and methods of controlling diseases. The experiments include the growing of a large number of different crops, and the use of various methods of controlling diseases. The results of these experiments have been very satisfactory, and the work has been continued with great success.

Experiments in Malahye

In addition to the work at Berri, the experiments at Malahye, near Nowra, have also been very successful. The work at Malahye has been conducted by Mr. E. J. Pethick, who has experimented with a large number of different crops and methods of controlling diseases. The results of these experiments have been very satisfactory, and the work has been continued with great success.
