**TEACHING TEACHERS**

**ADDRESS BY MR. REIMANN**

"Musical Manna from Heaven"

"Do not start your pupils on Liszt's harmonies and expect them to make genius out of them immediately," said Mr. J. N. Reimann, instructor in music, in the State Teachers College, at his address to the Teachers' Association earlier this morning.

He strongly urged well-qualified teachers to give attention at the outset to the part of music teaching to intelligently develop the human energy of those pupils who desire to make the world a better place, to develop the fact that many parents have not the musical mamas to fall from heaven.

"It is now universally admitted that music is a necessary part of a good education," said Mr. Reimann. "It is a necessity of the human spirit. Music is a factor in the education of youth.

"We, as teachers, have a duty to see that music is given the necessary attention that it deserves.

"The study of music, to be of value, should be considered as a directed, self-improving, self-sustaining activity."

He also stressed the importance of self-development in music, by pointing out that the world is full of musical opportunities. The world needs music; the world needs people who make music.

"Music is a universal language that transcends all barriers. Therefore, we must make music an essential part of our education system."

**THE CAUSE OF CANCER**

Without incurring an accusation of unreasonable skepticism, we may accept Dr. Gys's declaration that an English experimenter "has discovered the cause of cancer." Such a discovery must be regarded as a great campaign against this frightful scourge, and the statement that the cancer is caused by malignant disease has been so dramatically accepted that it is almost too good to be true.

Every investigator realizes that the finding of the cause of a disease is the aim of the vast research of scientific work which is being prosecuted in all parts of the world, and that it is now a reality that every thought of malignant disease has been thus suddenly and dramatically solved.

Dr. Gys is to be congratulated on his discovery, and his name will be eternally linked with the history of cancer research. His work is a milestone in the history of medicine, a discovery that will save countless lives.
