Some Aspects of Forestry

Twin Sister of Agriculture

Professor Sir Douglas Mawson delivered the annual address in connection with the celebration of Arbor Day, at Eider Hall, North Terrace, on the 22nd of November, on the aspects of forestry in South Australia.

The position of Australian agriculture has risen to such a high level that the quality of the produce is now commonly acknowledged to be superior to that of any other country. The growth of the industry has been accompanied by a rapid increase in the area of forests, and the Government has taken active steps to encourage the development of the industry. The forests are a valuable asset to the country, providing a source of raw materials for industries such as paper, timber, and furniture.

One of the most important aspects of forestry is the conservation of the forests. This involves the careful management of the forests to ensure that they are not depleted. The forests also provide a valuable source of water, as many streams and rivers originate from forested areas. The forests also serve as a habitat for many species of wildlife, which are an important part of the ecosystem. The forests also provide a valuable source of recreation for the public.

The forests are also an important source of revenue for the Government, as they provide a significant amount of timber and other forest products. The timber is used for a variety of purposes, such as construction, furniture, and paper.

The forests also play a vital role in the conservation of the environment. They help to regulate the climate, prevent soil erosion, and absorb carbon dioxide from the atmosphere.

In conclusion, forestry is an important aspect of the economy of South Australia, and it is essential that it is managed in a sustainable manner to ensure that it continues to provide a valuable asset to the country.
