July 14th, 28
Cripps's Corner,
Forest Row,
Sussex.

My dear Fisher,

Cutler told me that you were in trouble at home, but I did not know if I got home, and sent it in the Times, that the end had come. I gather that at the last, it must have been a relief, but I know you are sorrowing, and you have my sincere sympathy. Please give my very kind regards to your wife, who, I am sure, share in your grief.

Yours sincerely,

Lemuel Darwin.
P.S. in dominance.

It seems to me that the smaller the mean deviation (i.e., the less the difference from the mean this arising) the slower will dominance be evolved. We might, therefore, expect that the genes on which human height, for example, depend, when united, would often lead to an intermediate form. I don't see how to check this idea. Would it upset your Edinburgh paper calculations at all seriously?
