CRIPPS'S CORNER,
FOREST ROW,
SUSSEX.

Dear Fisher,

Here with my correction to my article on Natural Selection. I think it is plain where they would come in. I am inclined to ask the Review to print the type written paper, which are, I think, intelligible by themselves. I should prepare them by a word of explanation, saying that my error arose from fixing my attention on whether an organism was alone or...
below the average, and we must observe that however low in a series two organisms may have been eliminated or the lowest was advantageous to the species. I hope I am right, now. I have thought about it a good deal.

On another point, I wish the American would try it. By X-ray, made a differentiated series became wider as the generations succeeded each other.
This would be the least proof of the formation of small mutations.

I also send my Cambridge pamphlet. It contains much the same error, kinds not so frequent.

Yours sincerely,
L. Darwin
