1st. December 1915.

Dear Finney,

I am sure that I never made a comprehensive or methodical list of direcrticoes and I doubt if Yates ever did so. If done at all it would have been done at the last stage when we had satisfied ourselves that all 6x6 squares fell into twelve classes and when, though we were both sure that none of these classes yielded Graeco-Latin squares, it might have been thought useful to set out an absolutely foolproof statement of this fact. However, I doubt if Yates ever did present it this way and I am sure that I did not.

Yours sincerely,
