Monday night.

Mr. Peter R. 

Thank you very much indeed for such a delightful visit, and for all your kind and generous hospitality. It was all the greater pleasure from beginning to end.

You know, I think, how deeply your interest in my work encourages me, and that I value it more than the opinion of anyone else in the world. It has indeed been good if you to make these calculations from the Tsimshian data.

Really it would be rather fun if one can definitely show a different survival rate between two colonies in nature. The higher death rate in the little area would tend to round off
talked with me about the revolutionary prospects of these very small colonies.

I will try tonight put into the few pencil corrections in our paper which has looked at together, and will get it off to Darlington by registered post tomorrow. I found awaiting me here a letter from Beaufort (the photographer) from which I quote the following:

"The prints arrived safely. I have today made some exposures and have sent them to Kodachrome to be processed, with a note requesting speedy return. The Kodachromes, which you had arranged for April to send me, had reached me two days previously."

So all that seems in order. I shall start Donnstell soon calculations when he comes here this
I know how thrilled he will be.

P.S. I shall, I think, submit the relevant information from the Team data, as far as I can, to make it easy to handle, and will then send it to you, together with the data itself, so that you need to look at the actual records. I will write confirming the points which seem worth looking into, following your wonderfully kind promise to do this—which I do so deeply appreciate. It would be grand to get out a second joint-paper on this type of butterfly ecology, if you think it's worth it when you have had a further look at the data.

Thank you, my dear Ron, so much for all your help and interest.

Yours sincerely,
