My dear Sister,

I am delighted to report success.

I have noted for too nearly full six hours of Callimugha dominula. Owing to the exceptional conditions this year it was a big job, and I feared at one time that I should fail.

The larvae fed mainly at night, but came out to sun themselves and feed a little on nice days. This year of course there has been practically no suitable weather for this. Normally they would not matter, for one could get them at night. They are not easy to see, and a strong light is needed. The locality is close to the Great Alabone Aerodrome, from which so many aeroplanes have to bomb Germany. They fly over the swamp as they take off. So collecting them at night with a strong light would be an obvious
impossibly just now. So, with the matter as it is, I had begun to fear that I might see very few during the day, but fortunately did better than I had expected.

It is really most awkward having to let me stay on Wednesday night. I do so much appreciate it. Furthermore, that will give a chance to pull out the exhibits - which it would have been most difficult to find time for on Thursday. Perhaps, too, I can have the pleasure of helping you with Jones.

I lecture from 11:45 to 12:45 on Wednesday, so must catch the 1:40 train. I do hope I can get to you about 5. I will do my best.

Would it be possible to obtain

1) Shiny Aluminium
2) Concentrated hydrochloric acid
3) Ether, re-distilled? If so it would be an advantage, as there are not very many things to
I have not got a full analysis of the family of yellow bees. In the hope that she may get a chance to look at it later.

With best wishes to Ruth.

Yours etc.,

Henry
