April 21, 1937

Dear Huxley,

I have now looked through your chapter on Mendelism and Evolution, and must thank you for your many kind references to my own work. I thought at one place that you might have fairly expressed a warmer appreciation of what Ford has done. I have expressed almost everything I wanted to say in verbal emendations, often, no doubt, of mis-typings, though occasionally modifying the sense.

In respect of p 51 and some following sections, I doubt if polymorphism involves linked lethals so often as you suggest; though Gerould at least puts forward a strong case for this interpretation in Colias.

In one case, p 22, I have drafted a rather fuller statement, as, without it, it is difficult to say anything definite about polydactyly in the experimental crosses which have been made between domestic breeds.

Yours sincerely,

Typescript returned

Note

In case it may be convenient, I enclose bibliography with publication in Dominance marked (D)
