

26 January 1932.

Dr. J. Neyman,
Miodowa 23, S.I.I.W.,
WARSAW,
Poland.

Dear Dr. Neyman:

I was glad to have your letter, though sorry to read in your postscript that Poland is suffering in the depression. Things have been a good deal better in England since the abandonment of the gold standard, and I would not say it was impossible to obtain lecturing or other employment in statistics, if you want to tide over the crisis while keeping your post in Poland open. This is my general impression, though it would be necessary to get the opinion of the London School of Economics, and ^{other} the possible sources before going any further.

A number of foreign books have incorporated one or more of the tables from my book with the permission of myself and my publishers. All we have required is full acknowledgment of the source, and a copy of the publication. In the case of the short table you send, formal permission would seem scarcely necessary, and your readers might well have the advantage of the full table.

I have not in hand any further extension of the z-table. The only cases for which it would seem to be useful would be for higher odds $P = .001, .0001$ etc., but even these have rather limited application.

I had not heard of the incident you refer to, but in any case I should know that it was not with you that I had any cause to be offended.

Yours sincerely,
