5th February, 1952.

Dear Penrose,

Thanks for your list of proposed papers. It must be difficult to make them representative, either of their periods or of the contributions of their authors. In respect of the period 1935, from which you have chosen two papers of mine, I think they should be accompanied by two others of the same time which supplement them materially, and which, indeed, introduce the important topic of ascertainment. I mean Ann. Eugen. Vol. 6, No. 1, pp 13-25, "The effects of methods of ascertainment ... etc.", and the paper which shows how effects of variable and uncertain ascertainment can be eliminated in linkage tests, namely Vol. 7, No. 2, pp 87-104, "Tests of significance ... etc.". If you care to include these as representative of the first year or two when I was at the Galton Laboratory, I should be glad to give the necessary permission.

Yours sincerely,
