1st. October 1946.

Dear Stratton,

Thanks for your letter on the uniovular triplets. When I was studying triplets some years ago I had two or three cases judged to be uniovular on general and metrical resemblances, but did not investigate finger prints. Mrs. S. Holt, of the Galton Laboratory, is now doing a good deal with palm prints and perhaps finger prints also, and probably she would be glad of photographs of this case. My own impression is that the resemblance in finger prints even of
identical twins is somewhat capricious, and more than one worker has experienced difficulty in using them as a criterion.

I was glad to see your note on $D^U$. I hope you will be able to get estimates of its frequency, for its existence is extraordinary.

May I remind of the charts you have borrowed, which I shall want for my lectures this term.

Yours sincerely,
