

Amyloid fibril formation by bovine milk  $\alpha_{s2}$ - and  $\kappa$ -casein, and  
its inhibition by the molecular chaperones  $\alpha_{s1}$ - and  $\beta$ -casein

**By David C. Thorn**

School of Chemistry & Physics  
The University of Adelaide

Supervised by Prof. John A. Carver

A thesis submitted to The University of Adelaide  
for the degree of Doctor of Philosophy.

# Synopsis

The caseins ( $\alpha_{s1}$ ,  $\alpha_{s2}$ ,  $\beta$ , and  $\kappa$ ) are the predominant proteins of bovine milk. While having little sequence homology, they have similar structural and behavioural characteristics, e.g. they lack well-defined tertiary structures and exhibit a strong tendency to associate with themselves and each other to form milk micelles. This thesis describes work examining the propensity of individual casein proteins, their mixtures, and their minor components, to form long, rope-like,  $\beta$ -sheet-rich aggregates, termed amyloid fibrils. Amyloid fibril formation is of considerable research interest because of its intimate association with a wide range of debilitating diseases, including Alzheimer's, Parkinson's and Huntington's diseases and type II diabetes. Amyloid fibrils were formed at physiological pH and temperature by  $\alpha_{s2}$ -casein and  $\kappa$ -casein, but not  $\alpha_{s1}$ -casein,  $\beta$ -casein, or whole casein, i.e. the mixture of all casein proteins. Fibril formation was assessed via dye binding assays, transmission electron microscopy and X-ray fibre diffraction. What sets  $\alpha_{s2}$ - and  $\kappa$ -casein apart from the other casein proteins is that they both possess intra- and intermolecular disulfide linkages, giving rise to monomers and disulfide-linked dimers, respectively, or, in the case of  $\kappa$ -casein, larger multimeric species. Accordingly, these components of  $\alpha_{s2}$ - and  $\kappa$ -casein were isolated to examine their individual fibril-forming propensity. The monomeric form of  $\kappa$ -casein had the highest fibril-forming propensity whereas  $\alpha_{s2}$ -casein was most prone to fibril formation in its disulfide-linked dimeric form. Consequently, under conditions that reduce disulfide bonds, fibril formation by  $\alpha_{s2}$ -casein was inhibited whereas  $\kappa$ -casein fibril formation was promoted. Differences in the overall morphology of the fibrils were also observed with  $\alpha_{s2}$ -casein forming twisted 'ribbons' and  $\kappa$ -casein forming rigid 'rods'. Additionally, the ability of  $\alpha_{s1}$ - or  $\beta$ -casein to inhibit fibril formation by  $\alpha_{s2}$ - or  $\kappa$ -casein in a chaperone manner was investigated. In doing so, the inability of whole casein, which comprises considerable amounts of  $\alpha_{s2}$ - and  $\kappa$ -casein, to form amyloid fibrils was largely accounted for by the chaperone action of  $\alpha_{s1}$ - or  $\beta$ -casein. The significance of this work is further highlighted by the incidence of mammary *corpora amylacea*, an amyloid-like condition that infrequently develops within the mammary tissue of cows. The propensity of bovine  $\alpha_{s2}$ - and  $\kappa$ -casein to form amyloid fibrils under conditions comparable to those found *in vivo* strengthens the possibility of involvement by these proteins and suggests a preventative role of  $\alpha_{s1}$ - and  $\beta$ -casein in the development of this condition.

# Declaration

I declare that the work presented within this thesis is original work that, to the best of my knowledge, contains no material previously published or written by another person, except where due reference is given. Part of the written and practical work described in Chapters 1 and 2 was carried out during my Honours year at the University of Wollongong, but excepting this, no material contained herein has previously been submitted for the award of any other degree at this university or elsewhere.

I give consent to this copy of my thesis when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act 1968.

The author acknowledges that copyright of published works contained within this thesis, as listed below, resides with the copyright holder(s) of those works:

## Acknowledgements

The completion of this thesis would not have been made possible if not for the assistance and kindness of many, many people... In particular, a big thanks to my family for their unqualified support – both financial and emotional. Few understand just how hard it was to finish more than you. Above all, thank you for always believing in me. This, is for you...

To my second family in Adelaide – my family away from home – thanks for being there through what has been one of the most trying yet meaningful periods of my life. To my supervisor and ‘father’, John, thanks for your guidance, support, and friendship. To my ‘mothers’, Allyson and Marilyn, thanks for looking after me at home. To my ‘sister’, Megan, thanks for putting me back on track when I have strayed. And to my ‘brother’, Chris, thanks for the adventures in between!

To Tom, Scott, Dani, and the many other treasures to have graced the Carver group, you made the lab such a fun place to work over the years. As for the science, Heath, the “can-do” man, what would I’ve done without you?

Many thanks to the residents of Kathleen Lumley College – both past and present – for providing a great place to come home to each day. In particular, Thivanka, Shiv, big Pete, and not-so-big Pete, for their continual friendship and kindness.

An honourable mention goes to Muldoon, Candy, my supervisor, and the ladies at Workskil and SACC, not to mention Centrelink, for helping to see me through the post-funding years of my Ph.D. A big thanks also to Graham Mussared and Mark O’Donoghue for helping me through tough times.

Last but certainly not least, my dear Kelly, if there was ever a good reason to prolong a Ph.D., meeting you would have to be one. Your patience and understanding is beyond equal, and one would be hard pressed to find a more supportive and nurturing partner.
