ACKNOWLEDGEMENT

Firstly to my wonderful husband Dimitrios and our children Stavroula and Dion, thank you for your patience, your tolerance, your support and your love. Most of all thank you for believing in me and for never letting me, stop believing in myself, not only on this occasion but throughout years of study, I love you.

To Associate Professor Anne Wilson for your support especially over the last few weeks of the study, the words ‘keep going Deb’ are etched in my memory forever. To my clinical supervisors Ms Kathryn Cronin Network Senior Mental Health Clinician and Dr Anthony Dinesh Consultant Psychiatrist, thank you for always being just a phone call away. Thank you for the sharing of your professional and clinical knowledge and for never letting me wallow in my doubts and self pity for too long, it is appreciated.

To my peers, we have travelled a rugged journey, but we are nearly at our destination, thankyou for your support and friendship. To all my friends and work colleagues who have supported me however they were able and you know who you are, thank you for everything.
ABSTRACT

In January 2009 the first Mental Health Nurse Practitioner positions were rolled out in country South Australia, as a result of ongoing mental health reform at both commonwealth and state levels. This thesis reports on research comparing the practice model of a new Mental Health Nurse Practitioner Service, utilising a Mental Health Consultation Liaison model of care and an older, established, in-reach General Practitioner model, of mental health service delivery in a regional accident and emergency department in South Australia. The new Mental Health Nurse Practitioner Service is provided by a Mental Health Nurse Practitioner (Candidate), who secured a position with Country Health SA when they were rolled out in 2009.

To answer the research question ‘Does the Mental Health Nurse Practitioner Service improve mental health service delivery in the Accident and Emergency Department of the Whyalla Hospital?’ a comparative descriptive study design utilising an empirical and analytical approach was employed. The study compares waiting times, admission rates and re-presentations to the accident and emergency department within 28 days of the original presentation. It also compares the incidence of consultation with other health professionals and the referral to community based mental health services taking place from the Accident and Emergency Department for the two models.

The results of the study are presented and represent significant statistical differences between the two models of care. The major findings of the study conclude engagement with the Mental Health Nurse Practitioner (Candidate) provides an opportunity for specialised comprehensive mental health assessment, timely therapeutic engagement and early intervention commenced in the Accident and Emergency Department. The high rate of consultation liaison from the Accident and Emergency Department as well as referral to community based mental health services is consistent with enhanced care coordination.
