1.0 Literature Review

1.1 Introduction

1.2 The healthy alimentary tract
   1.2.1 Alimentary tract histology
   1.2.2 Cell renewal

1.3 The gastrointestinal lamina propria
   1.3.1 Role, structure and constituents
   1.3.2 Cellular components
   1.3.3 Extracellular matrix
   1.3.4 Role of the basement membrane in epithelial integrity

1.4 Chemotherapy and the alimentary tract
   1.4.1 Irinotecan

1.5 Signalling systems in mucositis
   1.5.1 The 5-phase model for the development of mucositis
   1.5.2 Mucositis signalling pathways
1.6 Matrix metalloproteinases (MMPs) 12
   1.6.1 Function 12
   1.6.2 Regulation of MMPs 12

1.7 MMPs in Cancer 13

1.8 The healthy alimentary tract, MMPs and the extracellular matrix 14

1.9 MMPs, tissue remodelling and disease 18
   1.9.1 MMPs in gut diseases 18
   1.9.2 MMP expression following chemotherapy 18
   1.9.3 Tissue injury and MMP synthesis 20
   1.9.4 MMPs and inflammation 21

1.10 Evidence for role of MMPs in mucositis 23
   1.10.1 Message generation and amplification phases 23
   1.10.2 Ulcerative phase 24
   1.10.3 Healing phase 26

1.11 Serum MMPs as biomarkers of mucositis 26

1.12 Theoretical opportunities for intervention 28

1.13 Conclusions 29

1.14 Aims of study 29

2.0 Selection of housekeeping genes for gene expression studies in a rat model of irinotecan-induced mucositis 30

2.1 Introduction 30

2.2 Materials and methods 33
   2.2.1 Animals 33
   2.2.2 Irinotecan-induced mucositis model 33
2.2.3 Histological Assessment 34
2.2.4 Immunohistochemistry 34
2.2.5 Reference gene selection and primers 35
2.2.6 RNA isolation and reverse transcription 39
2.2.7 Real-time PCR 39
2.2.8 Determination of reference gene expression stability 40
2.2.9 Calculation of relative expression of MMP2 40
2.2.10 Statistical analysis 41

2.3 Results 42
2.3.1 Response to treatment 42
2.3.2 Histological analysis 42
2.3.3 RNA quality 42
2.3.4 RT-PCR efficiency 43
2.3.5 Expression of housekeeping genes following irinotecan treatment 43
2.3.6 Stability of housekeeping genes within sample groups 47
2.3.7 Stability of housekeeping genes compared to normal tissue 47
2.3.8 MMP2 expression in the jejunum following irinotecan treatment 49
2.3.9 Validation of selected candidate housekeeping gene using MMP2 in the jejunum 51

2.4 Discussion 53

2.5 Conclusions 56

2.6 Acknowledgments 57
3.0 Matrix metalloproteinases are possible mediators for the development of alimentary tract mucositis in the DA rat 58

3.1 Introduction 58

3.2 Materials and methods 61

3.2.1 Animals 61

3.2.2 Experimental plan 61

3.2.3 Histological assessment 62

3.2.4 RNA isolation and reverse transcription 62

3.2.5 Real-time PCR 63

3.2.6 Immunohistochemistry 66

3.2.7 Statistics 67

3.3 Results 68

3.3.1 Response to treatment and histological analysis 68

3.3.2 MMP and TIMP gene expression following irinotecan treatment 70

3.3.3 Tissue levels of MMPs following irinotecan 72

3.3.4 Tissue levels of TIMPs following irinotecan 79

3.3.5 Plasminogens gene expression following irinotecan 79

3.4 Discussion 81

3.5 Conclusions 85

3.6 Acknowledgments 86

4.0 Irinotecan-induced alterations in intestinal cell kinetics and extracellular matrix component expression 87

4.1 Introduction 87

4.2 Materials and methods 91
4.2.1 Animal study 91
4.2.2 Histological assessment 92
4.2.3 TUNEL for apoptotic cells 92
4.2.4 Picro-sirius red staining for collagen 93
4.2.5 Masson’s trichrome staining 93
4.2.6 Immunohistochemistry 94
4.2.7 Statistics 95

4.3 Results 96
4.3.1 Response to treatment and histological analysis 96
4.3.2 Proliferation and apoptosis following irinotecan 96
4.3.3 Collagen fibres and basement membrane collagen following irinotecan 101
4.3.4 The expression of extracellular matrix proteins following irinotecan 105

4.4 Discussion 109

4.5 Conclusions 113

4.6 Acknowledgments 114

5.0 Serum MMPs as biomarkers of mucositis in cancer patients receiving cytotoxic chemotherapy 115

5.1 Introduction 115

5.2 Methods 117

5.2.1 Patient cohort 117

5.2.2 Analysis of medical records 117

5.2.3 Sample preparation for enzyme-linked immunosorbent assay (ELISA) detection of fecal calprotectin 118

Publications arising from this thesis
Chemotherapeutic agents, including irinotecan hydrochloride, are highly effective in the treatment of a range of cancers; however, they cause a variety of unwanted toxicities. Mucositis is the term used to describe the damage caused by cytotoxic agents to mucous membranes of the alimentary tract (AT). This condition affects 40-100% of patients depending on dose regimen. There is currently no effective treatment and the underlying molecular mechanisms are not fully understood. Previous research has shown that mucositis encompasses changes in stress response gene expression and subsequently activation of tissue injury and inflammation mediators.

Matrix metalloproteinases (MMPs) are a group of zinc-dependent endopeptidases; which have been shown to play a role in tissue injury and inflammation in many gastrointestinal disorders. Furthermore, MMPs mediate these phenomena through the regulation of the extracellular matrix (ECM). This work aims to elucidate whether MMPs contribute to the pathogenesis of mucositis and whether these can be used as biomarkers for mucositis development or be targeted for future treatment strategies. To investigate these aims, studies were performed in an animal model of irinotecan-induced mucositis. A pilot clinical study was also conducted.

To investigate the role of MMPs in mucositis pathogenesis, a time-course model of irinotecan-induced mucositis was utilised. Rats were administered with 200mg/kg irinotecan intraperitoneally at 0h and killed 30, 60, 90 min, 2, 6, 12, 24, 48, 72, 144h post-treatment. Sections were embedded in paraffin or frozen for further analysis. To ensure the accuracy of the molecular investigations in this thesis, the appropriateness of a range of housekeeping genes for normalisation of RT-PCR methods was investigated for the first time in this model. Findings indicated that the most suitable combination of genes
to use is Ywhaz/UBC in the jejunum and UBC/β-actin in the colon or UBC if restricted to a single housekeeping gene. Subsequent molecular and histological assessments demonstrated a significant alteration in gene expression and tissue levels of MMPs and their inhibitors (TIMPs) following irinotecan (p<0.05). The increase in MMP-2, -3, -9 and -12 levels was associated with inflammatory infiltrate and maximum tissue damage. In contrast, MMP-1 expression correlated with tissue restitution. Furthermore, histological techniques illustrated a substantial increase in total collagen deposits around crypts from 24h in the jejunum and colon. Fibronectin expression decreased significantly in both regions from 6-24h following treatment. Irinotecan induced a significant alteration in epithelial cell kinetics in both the jejunum and colon (p<0.05) and this correlated with changes in ECM components.

To determine if systemic MMP levels are useful markers of impending toxicity, a pilot clinical study was carried out. Eight patients receiving a variety of chemotherapy regimens were recruited. The most reported toxicity following treatment was diarrhoea. Analysis of patient serum samples revealed a 5.74-fold increase in systemic MMP-3 and a 2-fold increase in systemic MMP-12 levels following the administration of chemotherapy. Analysis of MMP-3 levels with patient symptoms revealed a correlation.

Findings from this thesis provide clear evidence demonstrating a role for MMPs and ECM components in the pathogenesis of irinotecan-induced mucositis. Alterations in total collagen deposits and fibronectin levels in the AT following treatment may underlie the dysregulated cell kinetics following treatment hence leading to toxicity. Furthermore, preliminary findings from the pilot clinical study suggest that circulating MMPs are potential biomarkers of gastrointestinal toxicity induced by specific chemotherapy agents.
All thanks to God for providing me with this opportunity and helping me achieve my PhD for without His assistance and guidance none of this would have been possible.

I extend my true and sincere gratitude to my three supervisors, Dr Rachel Gibson, Dr Joanne Bowen and Professor Dorothy Keefe for their invaluable guidance and continued support throughout my PhD. I very much value having you as my mentors. Your knowledge, enthusiasm and dedication towards medical research has stimulated my interest and allowed me to pursue this project.

Many thanks to all members of the Mucositis Research Laboratory - Andrea, Richard, Emma, Bronwen, Erin, Anthony and Roger. It has been very wonderful to undertake my PhD with such an enthusiastic and supportive research team.

To Mr. Thomas Sullivan at the Discipline of Public Health, University of Adelaide, thanks for providing the statistics for all studies in this thesis.

To my wonderful parents Mayada and Mohammed, without your love, support and continuous prayers I would not have gotten this far. You have been great life coaches, teaching me to always have faith in my abilities and pursue my dreams. Thank you.

To my siblings Nada and Abdul, thank you for always being there to cheer me up and giving me the support I needed. Nada, our frequent coffee outings and retail therapy went a long way. And thank you for always being there to help take care of baby. Abdul, thank you for always being there to accompany me to work when I needed to go in on weekends.
To my wonderful husband Essa, thank you for supporting all my endeavours and providing me with continuous encouragement. You always manage to put a smile on my face with your love, kindness and care. For baby Omar, thank you for keeping me up at night but more importantly for providing your dad and I with countless moments of laughter and happiness. You both (and all our children to come) mean the world to me.

Dr Rachel Gibson
Dr Rachel Gibson was my principal supervisor and therefore listed as a co-author on all publications arising from this thesis. She assisted in the development of my original research proposal and provided funding for the work that was completed during my candidature. In addition she read through many drafts of the individual papers as well as this thesis.

Professor Dorothy Keefe
Professor Dorothy Keefe was my co-supervisor and therefore listed as a co-author on all publications arising from this thesis. She assisted in the development of my original research proposal and provided funding for the work that was completed during my candidature. In addition she read through many drafts of the individual papers as well as this thesis.

Dr Joanne Bowen
Dr Joanne Bowen was my co-supervisor and therefore listed as a co-author on all publications arising from this thesis. She assisted in the development of my original research proposal and provided funding for the work that was completed during my candidature. In addition she read through many drafts of the individual papers as well as this thesis.

Associate Professor Richard Logan
Associate Professor Richard Logan is a member of the Mucositis Research Group. He assisted with all of the animal experiments undertaken in this study. He also read numerous drafts of the individual papers making up this thesis.
**Dr Andrea Stringer**

Dr Andrea Stringer is a member of the Mucositis Research Group. She assisted with all of the animal experiments undertaken in this study. She also read numerous drafts of the individual papers making up this thesis.
During my candidature, I was involved in several other studies, not presented in this thesis. These have resulted in primary authorship or co-authorship on several manuscripts. I am first author on an invited review. I have also contributed an invited book chapter on a newly emerging field in mucositis research.

This thesis is composed of 6 chapters: literature review, four distinct research chapters, followed by a general discussion. During the course of my candidature, four chapters were published, with a further one under review. Accordingly, each research chapter is written as a publication complete with introduction, materials and methods, results and discussions. Some minor editing of the chapters has been made to ensure a consistent format of the chapters, to avoid significant repetition and to include relevant data omitted from publications. Unavoidable repetition has occurred only as necessary due to the format of the paper.
The animal studies conducted were approved by the Animal Ethics Committee of The Institute of Medical and Veterinary Sciences and of The University of Adelaide. They complied with the National Health and Medical Research Council (Australia) Code of Practice for Animal Care in Research and Training (2004). Due to the potentially severe nature of the diarrhoea caused by irinotecan, animals were monitored four times daily and if any animals showed certain criteria (as defined by the Animal Ethics Committee) they were euthanased. These criteria included a dull ruffled coat with accompanying dull and sunken eyes, coolness to touch with no spontaneous movement, and a hunched appearance.

The clinical study was approved by the Ethics of Human Research Committee of the Royal Adelaide Hospital and was carried out in accordance with the Declaration of Helsinki. Informed consent was obtained from each patient prior to enrolment in the study. All patients were de-identified.
