## I INTRODUCTION

### CHAPTER 1. THE LONG TERM OUTCOME OF MANDIBULAR ORTHOGNATHIC SURGERY

1.1 Overview

## II REVIEW OF THE LITERATURE

### CHAPTER 2. ORTHOGNATHIC SURGERY

2.1 Background history of orthognathic surgery

2.2 Definition and causes of relapse

2.3 Skeletal relapse following mandibular advancement

2.3.1 Wire versus screw fixation

2.4 Skeletal relapse following mandibular setback

2.5 Long term skeletal relapse

2.6 Comparison of relapse between single jaw and double jaw surgery

### CHAPTER 3. CEPHALOMETRY

3.1 Introduction
3.2 Errors of projection................................................................................................... 48
3.3 Errors of landmark identification........................................................................... 49
3.4 Errors of digitising.................................................................................................... 52
3.5 Errors of measurement.............................................................................................. 53
3.6 Errors attributed to observer variability...................................................................... 54
3.7 Errors of superimposition......................................................................................... 55
3.8 The selection of a suitable line of reference............................................................ 57

CHAPTER 4 PSYCHOLOGICAL ASPECTS OF ORTHOGNATHIC SURGERY.............. 60
4.1 Introduction................................................................................................................ 60
4.2 Psychological aspects of orthognathic patients......................................................... 61
4.3 Psychological aspects of cosmetic rhinoplasty patients............................................ 68
4.4 Comparison of psychological profile between orthognathic patients and cosmetic rhinoplasty patients..................................................................................................... 71
4.5 The illness behaviour questionnaire........................................................................ 72
4.6 The generic health survey (SF-36) questionnaire..................................................... 76

CHAPTER 5. AESTHETIC CHANGES FOLLOWING ORTHOGNATHIC SURGERY.....78

III PATIENTS AND METHODS

CHAPTER 6. EVALUATION OF POSTERATIVE RELAPSE................................. 83
6.1 Selection of study sample......................................................................................... 83
6.2 Cephalometric assessment of relapse..................................................................... 85
   6.2.1 Superimposition and tracing procedure............................................................. 86
   6.2.2 Reference points and lines.................................................................................. 89
       6.2.2.1 Hard tissue points......................................................................................... 89
6.2.2 Cephalometric lines.................................................................91
6.2.3 Calculations of linear and angular variables........................93
   6.2.3.1 Linear and angular variables........................................93
6.2.4 Assessment of the effect of surgeon’s experience and time on the 
   long term relapse.......................................................................94
6.2.5 Statistical analysis of relapse..................................................95
6.2.6 Errors of cephalometric method............................................95
   6.2.6.1 Statistical analysis of the experimental error..................95
6.3 Assessment of postoperative occlusal stability..........................96
6.4 Evaluation of long term postoperative oral health.......................96

CHAPTER 7. PSYCHOLOGICAL EVALUATION OF ORTHOGNATIC 
SURGERY PATIENTS......................................................................98

7.1 Quality of life assessment........................................................98
7.2 Patient satisfaction following surgery.......................................98
7.3 Patient satisfaction and abnormal illness behaviour...................100

CHAPTER 8. PERCEPTION OF AESTHETIC OUTCOME FOLLOWING 
ORTHOGNATIC SURGERY...............................................................101

8.1 Silhouette construction technique.........................................101
8.2 Evaluators................................................................................102
8.3 Statistical analysis of aesthetic changes....................................103

IV RESULTS

CHAPTER 9. LONGTERM RELAPSE FOLLOWING MANDIBULAR 
ORTHOGNATIC SURGERY...............................................................105
CHAPTER 11. ASSESSMENT OF POSTOPERATIVE OCCLUSION AND ORAL HEALTH STATUS

11.1 The final postoperative occlusal stability
11.2 The relationship between cephalometric relapse and occlusal stability
11.3 Oral health status of patients at the final postoperative review
11.4 Is long term oral health influenced by the patient’s psychological background?

CHAPTER 12. PATIENTS’ PERCEPTION AND PSYCHOLOGICAL STATUS FOLLOWING ORTHOGNATIC SURGERY

12.1 Motivations for seeking orthognathic surgery
12.2 Patients’ perception of orthognathic surgery
12.3 Quality of life
12.4 Satisfaction following surgery and illness behaviour
12.5 Satisfaction after surgery and body image

CHAPTER 13. PERCEPTION OF ORTHOGNATICH SURGERY AESTHETIC OUTCOME

13.1 Introduction
13.2 Overall perceptions of facial profile changes
13.3 Perceptions of facial profile change according to evaluator groups
13.4 Perception of profile aesthetic changes according to gender of evaluators
13.5 Perception of profile changes according to the type of surgery

V DISCUSSION

CHAPTER 14. DISCUSSION

14.1 Methodological aspects
14.2 Long term relapse following mandibular surgery ....................................................... 174

14.2.1 Single jaw surgery versus 2-jaw surgery ....................................................... 177

14.2.2 The effect of postoperative follow-up period and surgeon experience on long term relapse ............................................................................................. 179

14.3 Long term postoperative occlusal stability and oral health status ......................... 180

14.4 Patients’ perception following orthognathic surgery ........................................ 183

14.5 Long-term quality of life evaluation following orthognathic surgery .................... 185

14.6 Perception of aesthetic profile change following orthognathic surgery ............... 187

VI CONCLUSION

CHAPTER 15. CONCLUSION ......................................................................................... 190

Summary

A retrospective study was performed to assess the treatment outcome following mandibular orthognathic surgery at an average follow up of 12.9 years (range 7 to 24 years) in 24 patients, in the Oral and Maxillofacial Surgery Unit (OMSU), The University of Adelaide. This study shows generally a good level of outcome measured by cephalometric, study models and psychological profile assessments for this long term evaluation of dentofacial surgical patients.

The investigation in this study involved a detailed assessment of the following:

1. Cephalometric evaluation of long term skeletal relapse using a series of lateral head radiographs for twenty patients. Comparative analyses were undertaken to determine the differences in relapse between single jaw osteotomy (n=9) and bimaxillary osteotomy (n=11). Additional examination of the data was also assessed to determine the effect of gender, surgeon’s experience and postoperative time on the observed relapse.

2. The final postoperative occlusion using study models and the oral health status of all samples using the decayed, missing and filled permanent teeth (DMFT) index.

3. Patient perception, psychosocial status and satisfaction of treatment outcome.

   This was investigated using psychological and social questionnaires (IBQ, BIQ, SF-36) reflecting the patient’s experience following surgery.

4. The perception of aesthetic improvement of soft tissue profiles. This involved construction of profile silhouettes from Pre- and long-term postoperative cephalograms.

   The facial profile changes were investigated by a panel that consisted of lay Omanis, lay Australians and professional surgeons and orthodontists.
The patients’ response rate for participation in this study was low (11%). This reflected the difficulty in locating patients 7 to 24 years after treatment.

The study sample that was investigated for skeletal relapse was similar in age and type of surgery to the total group but with a greater male predominance.

The study showed that the mean horizontal long term relapse was 3.1 mm (39%, p< 0.0009) and 2.3 mm (32%, p< 0.0004) measured at pogonion and B point, respectively. The mean vertical movement of the mandible and its subsequent relapse was minimal and statistically not significant. There was no statistical difference in long term relapse between single and bimaxillary cases, or between males and females. There was a better postoperative stability for patients managed by a more experienced surgeon compared to a group of 3 less experienced surgeons. The majority of relapses occurred in the early stages following the surgery.

Analysis of study models showed that 20 out of 24 patients had satisfactory dental occlusions. The final postoperative occlusal stability was independent of the observed skeletal relapse. This reflects the need for postoperative clinical monitoring by observation of both the dental occlusion and cephalometry.

The majority of patients maintained a good standard of oral health. Eighteen out of twenty four patients (75%) were caries-free and maintained the same number of teeth before and after surgery.

Patients who demonstrated signs of abnormal illness behaviour and abnormal body image were more likely to be dissatisfied with the surgical outcome. Psychosocial functioning in the long-term review was generally similar to that of the normal population when investigated by the SF-36 health survey questionnaire.
The overall aesthetic facial profile improvement was perceived at 11.6 years following surgery by different evaluator panels (p = 0.0048). Significant improvement was detected following bimaxillary correction of class III malocclusions (p < 0.0001) and after bimaxillary correction of Class II malocclusion (p = 0.0002), when combined with genioplasty advancement.

This study confirms that orthognathic surgery when evaluated many years later is stable and generally with a good outcome from both the patient and the clinicians perspective.
This thesis is submitted in partial fulfilment of the requirements for the degree of Doctorate of Clinical Dentistry. I, Mohammed AlAjmi declare that the text of this thesis contains no material which has been accepted for the award of any other degree or diploma in any university, and to the best of my knowledge contains no material previously published by another person except where due reference is made in the text.

I give consent to this copy of my thesis when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act, 1968.

I also give permission for the digital version of my thesis to be made available on the web, via the University’s digital research repository, the library catalogue, the Australian Digital Theses Program (ADTP) and also through web search engines, unless permission has been granted by the University to restrict access for a period of time.

Mohammed AlAjmi

Date..........................
I extend my thanks and gratitude to my principal supervisor, Professor Alastair Goss, Professor and Former Director of Oral and Maxillofacial Surgery, for providing me the opportunity to undertake a doctorate of clinical dentistry program in Oral and Maxillofacial Surgery. His encouragement, support and constructive feedback have been invaluable throughout my candidature.

Special thanks to Dr. Sambrook, Senior lecturer and Director of Oral and Maxillofacial Surgery, The University of Adelaide, and a co-supervisor of this work, for his guidance in clinical training and for his continuous reassurance and encouragement to complete my thesis.

I am very grateful for my employer, the Armed Forces Medical Services of the Omani Ministry of Defense for sponsoring my study and stay in Adelaide.

I must acknowledge Dr. Thomas Sullivan from the Department of Public Health, The University of Adelaide for providing me with statistical support.

I must extend my appreciation to Dr. Ricky Kumar and Dr. Abdul Rahman Alazri for their friendship, objective discussions and great support. They were there whenever I needed them.

My thanks and appreciation must go to Ms. Juliet Hugo, Research Assistant, for her help with the manuscript.

My sincere gratitude must also go to the entire Oral and Maxillofacial Surgery Unit staff and colleagues for the special times I spent in the unit with special thanks to Dr. Tim Surman for his help in providing some materials for the literature review section.

Finally, I am most grateful to my parents for their continuous support and encouragement and to my wife, Intidhar, for her limitless patience, understanding and love throughout my candidature. She and my three lovely daughters, Shahad, Fatema and Sara, were with me at all the time whether in Adelaide or back home in Oman.
