## ABSTRACT

A range of  $\beta$ -amidoalkyl phenylselenides were prepared in order to explore their cyclisation *via* oxidation of the selenium moiety to the selenone followed by intramolecular displacement. At first, the  $\beta$ -amidoalkyl phenylselenides were prepared in one-step from the alkenes. However, the one-step preparation was complicated by side-reactions and a two-step method was found to give clean reactions and higher yields of a wide range of the desired amido selenides.

Along with the expected oxazolines, isomeric *N*-acylaziridines were obtained from the cyclisation reaction. Formation of *N*-acylaziridines by cyclisation of amides is unusual, and variation of the conditions was explored in order to optimise this novel aziridine-forming reaction. It was found that conducting the oxidation reaction at low temperature favoured the aziridine products. In this way, the aziridines derived from all prepared  $\beta$ -amido selenides were obtained in good to excellent yield. From some substrates, the aziridine was obtained as the exclusive product.

The low temperature generation of a selenone from the corresponding selenide had not been reported previously. Experiments were carried out which provided evidence for the supposition that the intermediate in the cyclisation reaction was the selenone.

The preparation of  $\beta$ -amido selenides was also investigated using silver ion to sequester the halide of the selenium reagent, rendering the selenium species more electrophilic and its addition to the alkene to give a seleniranium ion, irreversible. The seleniranium ion was generated in the presence of nitrile to allow attack by the

weak nitrile nucleophile upon the seleniranium ion, giving a nitrilium ion. With addition of water to the nitrilium ion,  $\beta$ -amido selenides were formed in moderate yield. Thus, it was shown that the  $\beta$ -amido selenides could be prepared without the use of strong acid. Addition of azide to the nitrilium ion gave a tetrazole, which demonstrated that this methodology could provide access to selenides substituted at the  $\beta$ -position with groups other than the amido group.

$\beta$ -Benzamidocyclohexyl phenyl selenoxide and  $\beta$ -benzamidocyclohexyl phenyl selenone were prepared, and hydrogen bonding in the two compounds was examined spectroscopically. An X-ray crystal structure of the selenoxide showed intermolecular hydrogen bonding between the amide hydrogen and the seleninyl oxygen, in contrast to proposals in the literature that analogous selenoxides were stabilised by intramolecular hydrogen bonding in the solid state.

Three  $\gamma$ -hydroxy selenides were prepared and their low-temperature oxidation and cyclisation was explored with a view to obtaining the corresponding oxetanes. The low-temperature procedure did not translate successfully to the cyclisation of  $\gamma$ -hydroxy selenides to oxetanes, instead giving complex mixtures. However, with reference to literature conditions for the preparation of methoxy-substituted oxetanes, the  $\gamma$ -hydroxy selenides were cyclised to the corresponding oxetanes by oxidation in methanol at room temperature, demonstrating that the scope of this method could be widened to a more generalised preparation of oxetanes.

## STATEMENT OF ORIGINALITY

I certify that this work contains no material which has been accepted for the award of any other degree or diploma in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text. In addition, I certify that no part of this work will, in the future, be used in a submission for any other degree or diploma in any university or other tertiary institution without the prior approval of the University of Adelaide and where applicable, any partner institution responsible for the joint-award of this degree.

I give consent to this copy of my thesis, when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act 1968.

I also give permission for the digital version of my thesis to be made available on the web, via the University's digital research repository, the Library catalogue and also through web search engines, unless permission has been granted by the University to restrict access for a period of time.

## ACKNOWLEDGEMENTS

I thank David Ward for giving me the opportunity to work with this intriguing element, for sagely guiding my experimental endeavours, for generously editing my thesis chapters, and for being a steadfast presence throughout this long journey.

I have many happy memories of working in Lab 6, thanks to the good company of our postdocs, Matt Lucas and Pasquale Razzino. Thanks also to Herbert Foo for much helpful advice and assistance during my brief stay in Lab 3. I wish him a happy and successful career.

Thanks to the staff of the Chemistry Department, particularly Phil Clements for his expert assistance in obtaining NMR and mass spectra.

Many thanks to John Bowie and Simon Pyke for overseeing the final stages and making it possible for me to complete this work.

And thanks to Tricia, Hugh, Vanessa, Edward and Graham, and to my mother for their encouragement and the constant distractions.
