Abstract

This thesis presents an investigation into the direct CO\textsubscript{2} laser post processing of optical fibres, with a specific emphasis on soft glass compositions. It presents novel techniques for the fabrication of soft glass optical fibre based devices, novel techniques for the direct measurement of glass melt properties and the optical characterization of all fabricated devices, including a novel technique for measuring the evolution of ultra-short pulses along sub-wavelength tapered optical fibre.

New photonic devices fabricated from soft glass optical fibres are of scientific interest due to the high non-linearity and high refractive index. However for the increased understanding and controlled fabrication of such devices, measured values of the physical properties of the glass melts are required, and for many new materials this information is either unavailable or must be obtained for the exact conditions that the devices are produced.

This thesis presents new methods for the measurement of surface tension and viscosity at the same conditions as the fabrication of the optical devices presented, through the use of a scanning CO\textsubscript{2} laser. It also reports previously unpublished surface tension values for several glass compositions and investigates the effect the glass making environment had on the resulting surface tensions.

Novel fabrication techniques for new soft glass optical devices are also presented, including the pressurised tapering of Bismuth MOF using an elliptical CO\textsubscript{2} laser beam control the rate of microstructure collapse or expansion such as to produce a photonic crystal device whereby the zero dispersion wavelength varies as a function of displacement along the taper length.

The direct CO\textsubscript{2} laser tapering of silica and soft glass optical fibres to sub-wavelength diameters is also presented as well as the production of new high Q factor optical
microsphere’s resonators of diameters <10µm, fabricated from Er-Yb co-doped tellurite glass, and attached to tapers situated near the un-tapered optical fibre for mechanical stability.
Acknowledgements

Just before beginning my PhD my primary supervisor Jesper referred to me as an uncut diamond in terms of my experimental work. Now I’m finished I can’t help but feel somewhat cut and polished, though I think I’m still a little sore from the process ;)  

Firstly I would like to thank my extremely loving and understanding partner Beth and my mother Eleanor for putting up with me disappearing off to university at weird hours in the morning and all weekends to go work in the lab.

I’ve had the opportunity of working with some very good researchers who were pointed in my direction by my co-supervisor Tanya Monro. The first I encountered was Dominic Murphy, who lifted me out of a very major slump and helped get my first conference paper out, though on reflection I really should have pushed further and turned it into a journal article. The second is Heike, who helped me get my first journal paper out and set me to measuring just about every known composition of soft glass ;). Hopefully I get the opportunity of working with these people again.

Without the support of friends it is next to impossible survive a PHD. I can say this with absolute certainty: without the friendship of Miftar Ganija I would have given up on my PHD. Having friends to talk openly with about physics, politics and the pain and the suffering associated with research definitely has kept me moderately sane.

When you have been doing a PHD for as long as I have, you have you rely on a lot of people’s help. Without the staff from the School of Chemistry and Physics and their friendly support I would be in deep water, as well as out of work!

Big thanks to all the optics group members, past and present. One of the benefits of working in physics is getting to know some very interesting people from a diverse range of backgrounds. Thanks to all those who have supported me throughout the years, especially Jesper who has known me the longest and always had my back.
Statement of Originality

This work contains no material which has been accepted for the award of any other degree or diploma in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text.
