Declaration of Authorship

I, Alessio Bacci, declare that this thesis titled, 'Optimal Space Time Adaptive Processing for Multichannel Inverse Synthetic Aperture Radar Imaging' and the work presented in it are my own. I confirm that:

- This work was done wholly or mainly while in candidature for a research degree at this University.

- Where any part of this thesis has previously been submitted for a degree or any other qualification at this University or any other institution, this has been clearly stated.

- Where I have consulted the published work of others, this is always clearly attributed.

- Where I have quoted from the work of others, the source is always given. With the exception of such quotations, this thesis is entirely my own work.

- I have acknowledged all main sources of help.

- Where the thesis is based on work done by myself jointly with others, I have made clear exactly what was done by others and what I have contributed myself.

Abstract

Optimal Space Time Adaptive Processing for Multichannel Inverse Synthetic Aperture Radar Imaging

by Alessio Bacci

The thesis deals with the application of ISAR processing to obtain high resolution imaging of non-cooperative moving targets within a SAR scene. The research topic is of great interest nowadays. Modern SAR system can provide high resolution radar images of wide areas with reduced revisiting time. These features make them particularly suited for surveillance application. It is obvious that for these kind of applications the capability of imaging non-cooperative moving targets becomes fundamental. Since conventional SAR processing is unable to focus moving targets because of the lack of knowledge of the target motion a solution based on ISAR processing is proposed. In fact, ISAR systems, do not make any assumption about the target motion, but they exploit it to form the synthetic aperture and to obtain high resolution in the cross-range dimension. Since the ISAR processing must be applied to each target separately a detection step is fundamental. Although this detection step is not a problem when dealing with maritime targets, as the sea clutter return is usually much lower than the target return, it can a be a challenge when dealing with ground target. Multichannel information provided by SAR systems with multiple receivers can be exploited to mitigate the return of the static scene. STAP processing is then combined with ISAR technique to produce high resolution images of non-cooperative moving targets after detection within SAR images. The multichannel version of Range Doppler image formation algorithm is derived and analyzed. Then, it is used to define a Space Doppler Adaptive processing to mitigate the strong clutter before the application of ISAR autofocus. Performance are evaluated on simulated data. Results on real data prove the effectiveness of the proposed processing and its applicability on actual systems.

$\tilde{W}(n, m_v)$ Post-Doppler Optimum weightvector
$\tilde{W}_i(n, m_v)$ Post-Doppler Optimum weightvector ($i^{th}$ window)
$\tilde{W}_D(n, m_v)$ Space Doppler Optimum weightvector
$\tilde{W}_{D,i}(n, m_v)$ Space Doppler Optimum weightvector ($i^{th}$ window)
$X$ Stacked received signal vector
$Y$ Spatial frequencies
$y_s(\theta, n, m)$ Steered output in the direction $\theta$
$y_{t,p}(F_D, n)$ Focused output at $F_D$
$y(\theta, F_D, n)$ Focused output at $\theta, F_D$
$y^{(u)}$ useful output
Symbols

$y^{(c)}$  clutter (disturbance) output

$\mathbf{Z}$

$\mathbf{Z}(n_r)$  Target-free data in the $n_r$th range cell

$\alpha$

Angle between $\xi_3$ and $x_3$

$\beta(t)$  Bistatic angle variation

$\Delta$

Delay time resolution

$\Delta_{\nu}$  Doppler frequency resolution

$\Delta_{\nu_1}/\Delta_{\nu_2}$  Cross-range/range resolution

$\Delta Y_1/\Delta Y_1$  Spacial frequencies spacing

$\Delta \Theta$  Aspect angle variation

$\Theta$

Incidence angle

$\theta_{in}$

DoA

$\theta_{az}$  Azimuth aperture

$\nu$

Doppler frequency

$\nu$

$\rho_s(\Delta d)$  space correlation

$\rho_t(\Delta t)$  time correlation

$\sigma$

Reflectivity of the scatterer placed in $y$

$\sigma_k$  Reflectivity of the $k$th scatterer

$\sigma_T$  Reflectivity of a point like target (beamforming)

$\tau$

Delay time of the scatterer placed in $y$ at time $t$

$\Phi$

Phase term (monostatic case)

$\phi(y, f, t)$

$\phi_{Bf}(y, f, t)$  Phase term (bistatic case)

$\Omega$

Total rotation vector

$\Omega_T(t)$

Effective rotation vector

$\Omega_{eff}(t)$
