
MATRIX ANALYTIC METHODS WITH MARKOV DECISION PROCESSES FOR HYDROLOGICAL APPLICATIONS

Aiden James Fisher

December 2014

Thesis submitted for the degree of
Doctor of Philosophy
in the School of Mathematical Sciences at
The University of Adelaide

برای الهام

Acknowledgments

I would like to acknowledge the help and support of various people for all the years I was working on this thesis.

My supervisors David Green and Andrew Metcalfe for all the work they did mentoring me through out the process of researching, developing and writing this thesis. The countless hours they have spent reading my work and giving me valuable feedback, for supporting me to go to conferences, giving me paid work to support myself, and most importantly, agreeing to take me on as a PhD candidate in the first place.

The School of Mathematical Sciences for giving me a scholarship and support for many years. I would especially like to thank all the office staff, Di, Jan, Stephanie, Angela, Cheryl, Christine, Renee, Aleksandra, Sarah, Rachael and Hannah, for all their help with organising offices, workspaces, computers, casual work, payments, the postgraduate workshop, conference travel, or just for having a coffee and a chat. You all do a great job and don't get the recognition you all deserve.

All of my fellow postgraduates. In my time as a PhD student I would have shared offices with over 20 postgraduates, but my favourite will always be the "classic line" of G23: Rongmin Lu, Brian Webby, and Jessica Kasza. I would also like to give special thanks to Nick Crouch, Kelli Francis-Staite, Alexander Hanysz, Ross McNaughtan, Susana Soto Rojo, my protégé Stephen Wade, and my guide to postgraduate life Jason Whyte, for being my friends all these years. Brian Webby once again for helping me with, and co-authoring, my first research paper and for being there for me while I settled into postgraduate life.

Kunle Akande for his insights and advice about the Essex Transfer Scheme that helped in the writing of the paper he co-authored with me.

To my loving parents, Sue and Greg, who supported me emotionally and financially for most of the early years I was a PhD candidate. Also my brothers and sister, Damon, Dominic, and Shannon, for their support.

Most importantly I would like to thank my darling wife Elham for her love and support while writing this thesis. Without her encouragement I would I have never finished and it owes its existence to her.

Abstract

In general, a physical process is modelled in terms of how its state evolves over time. The main challenge of modelling is to describe this evolution without unnecessary computation or making unrealistic simplifying assumptions. Markov chains have found widespread applications in many fields of analytic study from engineering to biology to linguistics. One of their most notable applications in hydrological applications has been modelling the storage of reservoirs, as described in Moran's influential monograph ([Moran, 1955](#)). One of the fundamental properties of Markov chains is that the future evolution depends only on the present state, and not on any of the previous states. This property is simply stated as the "memory-less" property or the Markov property.

In a Markov chain model the states representing the physical process are discrete, but time can be modelled as either discrete or continuous. In this thesis, time is modelled in discrete units because this is consistent with the well-established theory of Markov decision processes. The discrete states need not be a practical limitation because of continuous state variables, as in this case storage in a reservoir, can be discretised as a reasonable approximation.

There have been many advances in Markov chain modelling techniques in other fields, most notably in telecommunications with the development of matrix analytic methods. Matrix analytic methods exploit the structure of certain types of Markov chains in order to more efficiently calculate properties of the models. This thesis examines how these methods can be applied to hydrological applications with the goal of providing a framework for which more precise modelling can be achieved without extending computational times. There are many unique challenges due to the seasonal nature of hydrology as well as the tendency for persistence of hydrological conditions. This thesis explores some of these problems in four papers.

The first paper looks at the issues surrounding hydrological persistence and its incorporation into Markov decision processes using the Southern Oscillation Index as proxy.

The second paper looks at modelling using matrix analytic methods of spate flows in the Cooper Creek, which is an ephemeral river located in the South Australia.

The third paper looks at a way of modelling hydrological persistence with underlying hidden states in contrast to assumed dependence on the Southern Oscillation Index.

The final paper looks at multi-objective optimisation using first-passage time distributions with an application to a two reservoir system in South East England. The Pareto front of Pareto optimal policies is shown.

Statement of Originality

I, Aiden James Fisher, certify that this work contains no material which has been accepted for the award of any other degree or diploma in my name in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text. In addition, I certify that no part of this work will, in the future, be used in a submission in my name for any other degree or diploma in any university or other tertiary institution without the prior approval of the University of Adelaide.

I give consent to this copy of my thesis when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act 1968.

I acknowledge that copyright of published works contained within this thesis (as listed below in the section titled "Published Works") resides with the copyright holders of those works.

I also give permission for the digital version of my thesis to be made available on the web, via the University's digital research repository, the Library catalogue, the Australasian Digital Theses Program (ADTP) and also through web search engines, unless permission has been granted by the University to restrict access for a period of time.

Preamble

This thesis has been submitted to the University of Adelaide for the degree of Doctor of Philosophy. According to the University's Specification for Thesis a Doctoral thesis may comprise,

a combination of conventional written narrative presented as typescript and publications that have been published and/or submitted for publication and/or text in manuscripts,

and this thesis takes this form.

The thesis has been divided into seven chapters:

The first chapter is a very brief introduction to the history of water management, the problems currently facing the world's water supplies, and the future in a changing climate.

The second chapter gives a brief introduction to discrete-time Markov processes or Markov chains. This chapter is only intended as a cursory view of the topic. A more general and in depth discussion can be found in any textbook on the topic, for example [Norris \(1997\)](#). A reader familiar with this material could skip this chapter.

The third chapter introduces several more advanced Markov models, including; the phase-type distribution, Markov arrival processes, and hidden Markov models.

The fourth chapter discusses solution techniques for Markov decision processes.

The fifth chapter comprises of a literature review of mathematical modelling of reservoirs and methods for determining optimal policy using Markov decision processes.

The sixth chapter comprises four published papers that form the main component of the thesis, along with an outline of each paper. The published papers are presented in the format they were printed in. All the papers have been scaled to the largest size possible that will allow the pages to fit within the University's specifications for a thesis.

The final chapter outlines potential future research following on from this thesis.
