ACKNOWLEDGEMENTS

As I finally begin to see the light at the end of the tunnel I would like to offer my heartfelt thanks to the following people without whom I could not have accomplished this journey:

The participants in my study who shared their thoughts with me and so willingly allowed me to spend time with them in support of my research. You have reaffirmed why I love doing what I do for a living.

My supervisor Frank Donnelly for your support, guidance, encouragement and insight. I am truly grateful for everything you have taught me and the patience you have extended me from day one of this journey.

The Human Research Ethics Committees of the University of Adelaide and Metro South Health for allowing me the opportunity to carry out my research for this thesis. Also a warm thank you to Meagan Mercurio and Kylie Ellis of Adelaide Research & Innovation; your assistance in facilitating the necessary communication required was invaluable.

My parents, Krish and Val, for pointing me in the direction of PACU nursing and for your unending support and encouragement for as long as I can remember. I am blessed to call you Mum & Dad.
My sister, Shoba, for your advice, your faith, your lesson in how to take on the task of coding and analysis and all your proof-reading. You have been brilliant and I am so proud of you.

Sue Jorgensen for your valuable insight during the analysis phase of this process and also to you, Jasper and Cadbury for living amongst the chaos and not holding it against me.

My colleagues who have feigned interest in my study and displayed enormous tolerance to support me on this venture. You are too many to name but I know who each of you are.

Team Pri: Anita Russell, Angela Schweikert, Cheryl Sutton & Debbie Rowland. You have mopped up tears, made me laugh, and kept my head above water when I thought I was drowning. Thank you.

And finally, Sammy Jorgensen. Thank you for everything you have done for me, not least of which was keeping calm and carrying on when I was convinced I was losing my mind amongst other things. Thank you for every 'I told you so' that you have refrained from saying over the past few years. And thank you for believing I could do this.
ABSTRACT

BACKGROUND: The post-anaesthetic care unit (PACU) is the first place that patients are taken following their operation and it is here that the initial recovery from their anaesthetic and surgery happens. Accordingly a significant proportion of the PACU nurse’s time is involved with the assessment and management of pain in the postoperative patient. Despite the implementation of standardised tools such as pain rating scales and medication protocols, the assessment and management of postoperative pain varies markedly from one patient to another in the PACU. Taking this into consideration, the researcher sought to understand how PACU nurses interpret pain assessment and management of the postoperative patient.

AIM: To understand the processes PACU nurses utilise when assessing pain and implementing subsequent pain management in patients following surgery.

METHODOLOGY: The qualitative approach of focused ethnography was used to frame this study. Focused ethnography was considered to best portray the perspectives of PACU nurses, as a culture, regarding the assessment and management of postoperative pain.

METHODS: Ten PACU nurses were recruited from the PACU of a government hospital. The experience of the participants ranged from 3 years to more than 20 years in PACU nursing. James Spradley’s ethnographic research cycle was used to frame the research process. The research design employed two methods of data collection: participant observation and individual interviews. Collected data was transcribed and thematic analysis conducted.

FINDINGS: Five themes emerged reflecting the perspectives of PACU nurses on the assessment and management of postoperative pain. These themes are: With Surgery Comes Pain; The Picture Beyond The Wound; Knowing; The Individual Experience; and Bridging Surgical Care. There are many complexities involved in assessing and managing postoperative pain in the PACU. Underpinning the five themes, communication was seen to be an integral aspect of assessing and managing postoperative pain from the PACU nurse’s perspective.

CONCLUSION: This study represents a population of nurses who identify strongly with working in a unique clinical environment. The findings give insight to the multi-dimensional process that PACU nurses employ to be able to provide proficient care of postoperative pain to their patients; and, this study illustrates that the PACU fosters a distinct sense of culture amongst its nurses when considering the assessment and management of pain in the postoperative patient. The significance of this research is that there is no set method of pain assessment and management the PACU that could be taught from a textbook. Postoperative pain assessment and management is a highly individualised process that continuously changes with variables that are introduced by both the PACU nurse and the patient. Further research is required to develop knowledge about this particular environment.
