

A Test of the Hutchinson Theory of Interspecific Competition

Richard John William Bosworth

B.Env.Sc. Honours (The University of Adelaide)

Submitted for the Degree of Doctor of Philosophy

In the School of

Animal and Veterinary Sciences,

Faculty of Sciences,

University of Adelaide

January 2012

Table of Contents

A Test of the Hutchinson Theory of Interspecific Competition	i
Table of Contents	ii
List of Tables	vi
List of Figures	viii
Abstract	xx
Declaration	xxiv
Acknowledgements	xxv
Chapter 1 General Introduction	1
1.1 Introduction	1
1.1.1 Project Aims.....	6
Chapter 2 Literature Review	7
2.1 Introduction	7
2.2 Competition.....	8
2.2.1 General Competition.....	8
2.2.2 Intra and Interspecific Competition	9
2.2.3 Resource partitioning	11
2.2.4 Dietary overlap.....	12
2.2.5 Metabolic rate	14
2.2.6 Summary	15
2.3 Hutchinson Theory	16
2.3.1 Background	16
2.3.2 Scientific Debate	16
2.3.3 Competition Models.....	18
2.3.4 Alternative explanations	19
2.3.5 Summary	20
2.4 Agricultural expansion	21
2.4.1 Agricultural expansion in Australia and on Kangaroo Island.....	21
2.4.2 Herbivore impact in Australia and Kangaroo Island	22
2.4.3 Summary	24
2.5 Species of Interest	24
2.5.1 Tammar Wallaby (<i>Macropus eugenii</i> Desmarest).....	24
2.5.1.1 Description.....	25
2.5.1.2 Diet, Habitat description and Distribution.....	26
2.5.2 Western Grey Kangaroo (<i>Macropus fuliginosus</i> Desmarest, 1817)	26
2.5.2.1 Description.....	26
2.5.2.2 Diet, Habitat description and Distribution.....	27

2.5.3	Sheep (<i>Ovis aries</i>).....	28
2.5.3.1	Description.....	28
2.5.3.2	Diet, Habitat description and Distribution.....	29
2.5.4	Goats (<i>Capra hircus</i>)	30
2.5.4.1	Description.....	31
2.5.4.2	Diet, Habitat description and Distribution.....	31
2.5.5	Summary	32
2.6	Carrying Capacity	33
2.6.1	Variation in DSE units	33
2.6.1.1	Domestic	33
2.6.1.2	Wildlife.....	34
2.6.2	Summary	34
2.7	Condition Score.....	34
2.7.1	Domestic	34
2.7.2	Wildlife	35
2.7.3	Summary	36
2.8	Capture Techniques for Macropod species	36
2.8.1	Non Drug Capture.....	36
2.8.2	Drug Capture.....	37
2.8.3	Summary	40
Chapter 3 Processing Experimental Animals		41
3.1	Assessment of Body condition.....	41
3.2	Source of experimental animals	42
3.3	Transporting of experimental animals.....	43
3.4	Sedation of Kangaroos	44
Chapter 4 Pasture Assessment on Kangaroo Island.....		47
4.1	Introduction	47
4.2	Methods	49
4.2.1	Study sites	49
4.2.2	Transect specifications.....	51
4.2.3	Plant Cover Survey	51
4.2.4	Plant Cover Analysis.....	52
4.2.5	Rainfall and Temperature	52
4.3	Results	52
4.3.1	Rainfall and Temperature	52
4.3.2	Pasture Comparison at three sites	54
4.3.2.1	Spring 2006.....	55
4.3.2.2	Summer 2007.....	57
4.3.2.3	Autumn 2007	59

4.3.2.4	Spring 2007.....	61
4.3.3	Pasture Comparison on both sides of a boundary fence	63
4.3.3.1	Chris's paddock	63
4.3.3.2	High Paddock	64
4.4	Discussion	65
Chapter 5 Dietary overlap of four herbivores on Kangaroo Island		69
5.1	Introduction	69
5.2	Methods.....	71
5.2.1	Faecal Collection Study Sites	72
5.2.2	Faecal Identification and Preparation	72
5.2.3	Tammar Wallaby (<i>Macropus eugenii</i>).....	73
5.2.4	Western Grey Kangaroo (<i>Macropus fuliginosus</i>).....	73
5.2.5	Sheep (<i>Ovis aries</i>).....	73
5.2.6	Goat (<i>Capra hircus</i>).....	73
5.2.7	Plant Reference Collection	74
5.2.8	Formal Identification of plant species.....	74
5.2.9	Cuticle Identification – Reference collection	74
5.2.10	Faecal Preparation.....	75
5.2.11	Histological Reference.....	75
5.2.12	Histological Analysis	76
5.3	Results	77
5.3.1	Cuticle Analysis	77
5.3.1.1	Spring 2006.....	78
5.3.1.2	Summer 2007.....	83
5.3.1.3	Autumn 2007	90
5.3.1.4	Spring 2007.....	98
5.4	Discussion	103
Chapter 6 Condition Score.....		108
6.1	Introduction	108
6.2	Methods.....	110
6.3	Results	113
6.4	Discussion	117
Chapter 7 Competition Trials.....		122
7.1	Introduction	122
7.2	Methods.....	126
7.2.1	Site	126
7.2.2	Trial Pens	127
7.2.3	Capture and transportation of all herbivore species.....	128
7.2.4	Sowing of Trial Pens.....	128

7.2.5	Plant Survey	129
7.2.6	Analysis of Data.....	129
7.3	Results	129
7.3.1	Plant survey: Mixed species grazing trial	129
7.3.1.1	Plant by number in mixed grazer pens	129
7.3.1.2	Plant by biomass in mixed grazer pens	132
7.3.2	Plant survey: Single species grazing trial	135
7.3.2.1	Plant by number in single grazer pens.....	135
7.3.2.2	Plant by biomass in single grazer pens.....	140
7.4	Discussion	143
Chapter 8 Food preference of four Kangaroo Island herbivores		149
8.1	Introduction	149
8.2	Methods.....	150
8.2.1	Palatability Trial.....	150
8.2.1.1	Trial sites	151
8.2.1.2	Data collection and Analysis	151
8.2.2	Oat grain trial	152
8.2.2.1	Trial site.....	152
8.2.2.2	Capturing of Wallabies	152
8.2.2.3	Data analysis.....	152
8.3	Results	152
8.3.1	Palatability trial Ranked visits	152
8.3.1.1	Wallaby.....	153
8.3.1.2	Kangaroo	155
8.3.1.3	Goat	157
8.3.1.4	Sheep	159
8.3.1.5	Food Varieties.....	161
8.3.1.6	Summary.....	164
8.3.2	Oat grain trial	165
8.3.3	Summary	168
8.4	Discussion	169
Chapter 9 Alternative explanation		172
9.1	Introduction	172
9.2	Methods.....	173
9.2.1	Lower dental arcade width.....	174
9.2.2	Tongue length	174
9.2.3	Lip length.....	174
9.2.4	Incisor/Pad length	174
9.2.5	Data Analysis	174

9.3	Results	175
9.4	Discussion	181
Chapter 10	General Conclusion	185
Appendix 1	Drug use and methods	191
Appendix 2	Cuticle pictures and Pant Identification	197
References	202

List of Tables

Table 1.1	Thesis Structure	6
Table 3.1	Description of the five stages of alpha-chloralose ingestion.	45
Table 4.1	Results of ANOVA analysis (P = 0.05 significance level) of pasture on both sides of a recently erected boundary fence in Chris’s paddock on a sheep property, Borda Vale at Cape Borda. Abbreviations: Spr – Spring, Sum – Summer and Aut – Autumn. ..	64
Table 4.2	Results of ANOVA analysis (P = 0.05 significance level) of pasture on both sides of a recently erected boundary fence in High paddock on a sheep property, Borda Vale at Cape Borda. Abbreviations: Spr – Spring, Sum – Summer and Aut – Autumn. ..	65
Table 5.1	List of plant species, common names and corresponding identification codes from cuticle analysis of plants occurring at the study site. D = Dicotyledon and M = Monocotyledon. The order is not sequential in the monocotyledon section to enable plants with the same genus to appear together.	77
Table 5.2	Diets of four herbivores on the north-western region of Kangaroo Island in October 2006. Significant results are in bold red and plant species with dashes through the square indicates the species was not present in the diets.	81
Table 5.3	Pianka’s index C on the dietary overlap among Tammar wallaby, Western Grey Kangaroo, Goat and Sheep in the north-western region of Kangaroo Island during Spring 2006. C = 0 indicates no overlap and C = 1 indicates complete overlap.	83
Table 5.4	Diets of four herbivores on the north-western region of Kangaroo Island in January 2007. Significant results are in bold red and plant species with dashes through the square indicates the species was not present in the diets.	86

Table 5.5 Pianka's index C on the dietary overlap among Tammar wallaby, Western Grey Kangaroo, Goat and Sheep in the north-western region of Kangaroo Island during Summer 2007. C = 0 indicates no overlap and C = 1 indicates complete overlap.	90
Table 5.6 Analysis results of the diets of four herbivores on the north-western region of Kangaroo Island in May 2007. Significant results are in bold red and plant species with dashes through the square indicates the species was not present in the diets.	93
Table 5.7 Pianka's index C on the dietary overlap among Tammar wallaby, Western Grey Kangaroo, Goat and Sheep in the north-western region of Kangaroo Island during autumn 2007. C = 0 indicates no overlap and C = 1 indicates complete overlap.	97
Table 5.8 Diets of four herbivores on the north-western region of Kangaroo Island in October 2007. Significant results are in bold red and plant species with dashes through the square indicates the species was not present in the diets.	101
Table 5.9 Pianka's index C on the dietary overlap among Tammar wallaby, Western Grey Kangaroo, Goat and Sheep in the north-western region of Kangaroo Island during spring 2007. C = 0 indicates no overlap and C = 1 indicates complete overlap.	103
Table 6.1 Allocation of Condition Scores to animals on the basis of their Condition Score Index.	111
Table 8.1 Averaged rank value of five test mammals for each species, the lower the ranked value indicated a preference for that food variety.	153
Table 8.2 Identification number and weights of each wallaby in the oat seed trial from 24 th November to 7 th December 2008 inclusive.	166
Table 9.1 A visual summary diagram of absolute morphological features that was significantly different among the four herbivore species. Colour differences across rows signify features that are significantly different between species.	180
Table 9.2 A visual summary diagram of standardised morphological features that was significantly different among the four herbivore species. Colour differences across rows signify features that are significantly different between species.	180

List of Figures

Figure 2.1 Female tammar wallabies in the fauna yard pen at the Roseworthy Campus, University of Adelaide.....	25
Figure 2.2 Kangaroo Island western grey kangaroos in holding yards at Roseworthy campus, University of Adelaide.....	27
Figure 2.3 Merino sheep in a holding yard at the Roseworthy farm, University of Adelaide.	29
Figure 2.4 Distribution and density of sheep within Australia. Source www.meares.com.au/resource/sheep01.htm . Accessed (21/8/06).....	30
Figure 2.5 Feral goats in a holding yard at the Roseworthy campus of the University of Adelaide.	31
Figure 3.1 Capturing of the wallabies at Roseworthy campus fauna yards using nets. The wallaby was placed into a hessian bag (in background hung on fence), hung on a frame and transported.....	44
Figure 4.1 Satellite image of the two areas on the north-western side of Kangaroo Island, Cape Borda property, the circled area on the left and De Mole River property, the circled area on the right. Image courtesy of Google maps	50
Figure 4.2 First study site at Borda Vale, Chris's Paddock. Image courtesy of Google maps	50
Figure 4.3 Second study site on Borda Vale, High Paddock. Image courtesy of Google maps.	50
Figure 4.4 Third study site, Duncan's Paddock. Image courtesy of Google maps.....	51
Figure 4.5 Monthly rainfall (mm on Y axis) totals over an 18 month period from May 2006 until October 2007. Months with an asterisk indicate months when pasture assessment occurred.....	53

Figure 4.6 Monthly mean overnight temperature (on the Y axis is in Celsius) for an 18 month period recorded at Cape Borda weather station which includes pasture assessment months with an asterisk.....	54
Figure 4.7 Monthly mean day temperature (on the Y axis is in Celsius) for an 18 month period recorded at Cape Borda weather station which includes pasture assessment months with an asterisk.	54
Figure 4.8 Percentage cover of moss in the pasture at the three sites in spring 2006 (P<0.001, df = 59). Different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among sites.	55
Figure 4.9 Percentage cover of clover in the pasture at the three sites in spring 2006 (P<0.001, df = 59). Different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among sites.	56
Figure 4.10 Percentage cover of daisy in the pasture at the three sites in spring 2006 (P<0.001, df = 59). Different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among sites.	56
Figure 4.11 Percentage cover of grass in the pasture at the three sites in spring 2006 (P=0.006, df = 59). Different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among sites.	57
Figure 4.12 Percentage cover of bare ground in the pasture at the three sites during summer 2007 (P<0.001, df = 59). Different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among sites.....	58
Figure 4.13 Percentage cover of moss in the pasture at the three sites in summer 2007 (P<0.001, df = 59). Different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among sites.	58
Figure 4.14 Percentage cover of daisy in the pasture at the three sites during summer 2007 (P<0.001, df = 59). Different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among sites.	59
Figure 4.15 Percentage cover of bare ground in the pasture at the three sites in autumn 2007 (P<0.001, df = 59). Different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among sites.	60

Figure 4.16 Percentage cover of moss in the pasture at the three sites in autumn 2007 (P<0.001, df = 59). Different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among sites.	60
Figure 4.17 Percentage cover of daisy in the pasture at the three sites in autumn 2007 (P<0.001, df = 59). Different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among sites.	61
Figure 4.18 Percentage cover of grass in the pasture at the three sites in autumn 2007 (P<0.001, df = 59). Different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among sites.	61
Figure 4.19 Percentage cover of moss in the pasture at the three sites in spring 2007 (P<0.001, df = 59). Different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among sites.	62
Figure 4.20 Percentage cover of daisy in the pasture at the three sites in spring 2007 (P<0.001, df = 59). Different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among sites.	62
Figure 5.1 Spring diet of sheep in Kangaroo Island's north-western region in 2006.	78
Figure 5.2 Spring diet of goats in Kangaroo Island's north-western region in 2006.	79
Figure 5.3 Spring diet of kangaroos in Kangaroo Island's north-western region in 2006.	79
Figure 5.4 Spring diet of wallabies in Kangaroo Island's north-western region in 2006.	80
Figure 5.5 Dicotyledon species <i>Allocasuarina verticillata</i> P=0.042 (df = 15) in diets of four herbivores. The different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among species.	81
Figure 5.6 Monocotyledon species <i>Vulpia myuros</i> in diets of four herbivores P=0.002 (df = 15). The different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among species.	82
Figure 5.7 Monocotyledon genus <i>Ehrharta</i> in diets of four herbivores P<0.001 (df = 15). The different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among species.	82

Figure 5.19 Autumn diet of kangaroos in Kangaroo Island's north-western region in 2007.....	92
Figure 5.20 Autumn diet of wallabies in Kangaroo Island's north-western region in 2007.....	92

Figure 5.21 Dicotyledon species <i>Trifolium subterraneum</i> P=0.001 (df = 15) in diets of four herbivores. The different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among species.....	94
Figure 5.22 Dicotyledon species <i>Allocasuarina verticillata</i> P=0.038 (df = 15) in diets of four herbivores. The different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among species.....	94
Figure 5.23 Dicotyledon species <i>Dodonaea viscosa</i> P=0.003 (df = 15) in diets of four herbivores. The different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among species.....	95
Figure 5.24 Dicotyledon species <i>Astroloma conostephioides</i> P=0.019 (df = 15) in diets of four herbivores. The different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among species.....	95
Figure 5.25 Monocotyledon species <i>Vulpia myuros</i> in diets of four herbivores P=0.044 (df = 15). The different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among species.	96
Figure 5.26 Unidentified monocotyledon species in diets of four herbivores P<0.001 (df = 15). The different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among species.....	97
Figure 5.27 Spring diet of sheep in Kangaroo Island's north-western region in 2007.....	98
Figure 5.28 Spring diet of goats in Kangaroo Island's north-western region in 2007.....	99
Figure 5.29 Spring diet of kangaroos in Kangaroo Island's north-western region in 2007.	99
Figure 5.30 Spring diet of wallabies in Kangaroo Island's north-western region in 2007.	100
Figure 5.31 Dicotyledon species <i>Arctotheca calendula</i> P=0.045 (df = 14) in diets of four herbivores. The different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among species.....	101

Figure 5.32 Dicotyledon species <i>Acacia leiophylla</i> P=0.009 (df = 14) in diets of four herbivores. The different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among species.....	102
Figure 5.33 Dicotyledon species <i>Juncus pallidus</i> P<0.001 (df = 14) in diets of four herbivores. The different alphabetical characters indicate significant differences (P<0.05, mean + SEM) among species.....	102
Figure 6.1 Comparison of mean body weight (kg) in lactating and non-lactating wallabies captured during drought conditions. There were no significant differences between the mean body weights of lactating (n = 11, mean ± SEM) and non-lactating (n = 17, mean ± SEM) wallabies (P = 0.104, ns).	114
Figure 6.2 Comparison of the initial mean body weight (kg) of 11 wallabies that were lactating at capture with their mean body weight after six months non-lactating on a high quality diet (Paired T-Test P < 0.001, SEM = 0.330).....	114
Figure 6.3 Comparison of the initial mean body weight (kg) of 17 wallabies that were non-lactating at capture with their mean body weight after six months on a high quality diet (Paired t-test P = 0.047, SEM = 0.191).....	115
Figure 6.4 Change in the spectra of condition scores of wallabies captured during a drought and after 6 months on high quality feed.	116
Figure 6.5 Correlation between CSI (Condition Score Index) on the Y axis and KFI (Kidney Fat Index) on the X axis (R ² = 0.48).....	116
Figure 6.6 Relationship between CSI (Condition Score Index) on the X axis and left perirenal fat mass (Standardised Fat Index) on the Y axis (R ² = 0.52).	117
Figure 6.7 Correlations between CSI (Condition Score Index) on the X axis and CMI (Crus Muscle Index) on the Y axis. A quadratic line has been fitted (R ² = 0.94) to define the point of inflection to define the boundary between CS2 and CS3. Whilst a second linear line has been fitted (R ² = 0.76) highlighting the relationship between CSI (Condition Score Index) and CMI (Crus Muscle Index) >CSI 7.9.....	117
Figure 7.1 Diagram of pen layout. Each single species pen had 4 animals except for wallaby pen that had 16 animals and had approximately similar grazing pressure to the 3 and 4 species pens. Mixed 4 spp. pens contained 1 kangaroo, 1 goat, 1 sheep and 4	

tammar wallabies while the mixed 3 spp. pens contained 1 kangaroo, 1 goat and 1 sheep.	127
Figure 7.2 Mean rye grass plant numbers present (m^2) between 3 species and 4 species pens ($P = 0.578$ at 0.05 significance level, means + SEM, $df = 5$). No significant difference was detected between species pens.....	130
Figure 7.3 Mean young Oat grass plant numbers present (m^2) between 3 species and 4 species pens ($P = 0.929$ at 0.05 significance level, means + SEM, $df = 5$). No significant difference was detected between species pens.....	130
Figure 7.4 Mean caltrop plant numbers present (m^2) between 3 species and 4 species pens ($P = 0.82$ at 0.05 significance level, means + SEM, $df = 5$). No significant difference was detected between species pens.	131
Figure 7.5 Mean lucerne plant numbers present (m^2) between 3 species and 4 species pens ($P = 0.681$ at 0.05 significance level, means + SEM, $df = 5$). No significant difference was detected between species pens.....	131
Figure 7.6 Mean marsh mallow plant numbers present (m^2) between 3 species and 4 species pens ($P = 0.23$ at 0.05 significance level, means + SEM, $df = 5$). No significant difference was detected between species pens.....	131
Figure 7.7 Mean potato weed plant numbers present (m^2) between 3 species and 4 species pens ($P = 0.46$ at 0.05 significance level, means + SEM, $df = 5$). No significant difference was detected between species pens.....	132
Figure 7.8 Mean wire weed plant numbers present (m^2) between 3 species and 4 species pens ($P = 0.282$ at 0.05 significance level, means + SEM, $df = 5$). No significant difference was detected between species pens.....	132
Figure 7.9 Young Oat grass plant mean weight (g) between 3 species and 4 species pens ($P = 0.8$ at 0.05 significance level, means + SEM, $df = 5$) there was no significant difference between species pens.	133
Figure 7.10 Potato weed mean weight (g) between 3 species and 4 species pens ($P = 0.161$ at 0.05 significance level, means + SEM, $df = 5$). No significant difference was detected between species pens.	133

Figure 7.11 Lucerne plant mean wet weight (g) between 3 species and 4 species pens (P = 0.111 at 0.05 significance level, means + SEM, df = 5). No significant difference was detected between species pens.	134
Figure 7.12 Rye grass plant mean weight (g) between 3 species and 4 species pens (P = 0.11 at 0.05 significance level, means + SEM, df = 5). No significant difference was detected between species pens.	134
Figure 7.13 Caltrop mean weight (g) between 3 species and 4 species pens (P = 0.207 at 0.05 significance level, means + SEM, df = 5). No significant difference was detected between species pens.	134
Figure 7.14 Marsh Mallow mean weight (g) between 3 species and 4 species pens (P = 0.32 at 0.05 significance level, means + SEM, df = 5). No significant difference was detected between species pens.	135
Figure 7.15 Wire weed mean weight (g) between 3 species and 4 species pens (P = 0.002 at 0.05 significance level, means + SEM, df = 5). A significant difference was detected between species pens indicated by different alphabetical characters.	135
Figure 7.16 Mean number of Lucerne plants present (m ²) in all single species and control pens. Different alphabetical characters indicate significant differences (P <0.001 at 0.05 significance level, means + SEM, df = 69) among single species pens. Graph legend Wallaby – W, Kangaroo – K, Goat – G, Sheep – S and Ungrazed Control – UGC.	136
Figure 7.17 Mean number of Rye grass plants present (m ²) in all single species and control pens. Different alphabetical characters indicate significant differences (P<0.001 at 0.05 significance level, means + SEM, df = 69) among single species pens. Graph legend Wallaby – W, Kangaroo – K, Goat – G, Sheep – S and Ungrazed Control – UGC.	136

Abstract

Kangaroo Island is of high conservational significance with the largest remaining interface between native vegetation and agriculture in South Australia. The two main native herbivores on Kangaroo Island are the western grey kangaroo and the tammar wallaby. Two introduced herbivores, sheep and feral goat, also contributed to the study. All animal species coexist in the north western districts of Kangaroo Island. All species coexisted at the Borda Vale property, Cape Borda and Correll property de Mole River field sites.

Competition between mammals on Kangaroo Island was investigated to determine if the Hutchinson Theory of Interspecific Competition could be either rejected or not-rejected. Hutchinson's theory states that an animal needs to be at least 2.1 times either larger or smaller in body weight than another competitor in the same environment to escape the influences of interspecific competition. The current investigation was two pronged; comprising field studies with subsequent analysis of plant cuticles from faecal matter, and secondly scientific trials on the mainland held at The University of Adelaide, Roseworthy campus, South Australia. The *in situ* field studies involved collecting faecal samples from each species and pasture comparison at three sites. The pasture structure on both sides of the recently erected boundary fence at two sites on Borda Vale was determined. Plant cuticles from faecal samples provide insight to the dietary composition for each species, and any dietary overlap between species. The body condition of all herbivores in the trial was assessed prior to the pen trials. Recognised body condition assessment methods for sheep and goat were available, but not for the macropods. Therefore, a condition score system (CS) was devised utilising biological indices as the basis of the CS system. Pen

trials included species-specific pens and mixed species pens, a total of eleven half hectare pens. Each pen had the same pasture plant structure with a plant survey determining the level of competition among the four species. A palatability/cafeateria trial of the pen plant species was undertaken by placing replicated plant specific pots in a test arena to record food preference for each animal species. Animals from each of the four species had mouth characteristic data recorded to detect any morphological differences which could provide an alternative explanation to the Hutchinson theory.

Pasture at all three sites fluctuated with seasonal condition, with the exception of bryophytes, that were only present in pastures on Borda Vale. The dietary overlap results (average C 0.14) indicated a low dietary overlap among the four herbivores throughout the four seasons. However, the greatest average seasonal dietary overlap result was between pairs of herbivores, occurring in spring (C 0.76 and C 0.85), when regrowth is at its greatest. In summer (C 0.70) and autumn (C 0.67) the dietary overlap decreased slightly, due to diversification of plant species eaten, with the increase of native browse vegetation in the diet. The wallaby, the smallest competitor, is in direct competition with the three larger competitors, with the greatest competition for resources being with the kangaroo (C 0.90) throughout the seasons.

The condition score (CS) indices were applied to both macropods. However; the focus was mainly on the CS system for the tammar wallaby. The development of the CS system included four body indices. The system has five condition score levels, ranging from level one, representing an animal in very poor body condition, to level five, representing an animal in optimal condition. The boundary between being fit for this trial work and not fit occurred at CS 2 and CS 3. Locomotive performance was impaired below CS 3.

Therefore, animals that failed to achieve CS 3 status were rejected from inclusion in the trials.

The two pen trials, one replicated and one pseudo-replicated, indicated that all herbivore species ate all of the pasture species on offer. Only a proportion of the competitive interactions between the mammalian grazing herbivores of Kangaroo Island were consistent with the predictions of the Hutchinson Theory. The results of the study produced some instances in which the smallest animal was the more effective forager. In several instances, no differences were detected, and in two instances (*Althaea officinalis* and *Heliotropium europaeum*) two of the larger grazers were more effective than the wallaby. Also, there was an instance in which one large herbivore had an advantage over another large herbivore for *Tribulus terrestris*. However, it appeared that the wallaby ate none of the oat grain (*Avena sativa*) even though it was the most abundant potential food source available in the trial pens. Further investigations of the palatability of fodder in the pen trial are indicated.

Further investigation into the association between the wallaby and ingestion of oat grain were undertaken. Wallabies ate oat grain only as a last resort, and were not able to maintain good body condition on a diet of oats. The finding that wallabies find oat grain unpalatable has ramifications for the farmers and conservation management on Kangaroo Island during drought condition, when hand feeding of oat grain is the major form of supplementary feeding of sheep.

Many factors may explain the lack of support for the Hutchinson Theory of size displacement in this study. The absolute morphological characteristics of lip length, incisor length, tongue length and lower dental arcade width of the wallaby were

statistically smaller than all the larger herbivores species in this study. Although the morphological differences (corrected for scale) in mouth structures revealed some statistically different characteristic among the four herbivores with no wallaby characteristic being statistically smaller or larger than all of the larger herbivores species. Other factors that could explain species diet separations, thereby reducing direct competition, are discussed including, height of reach, eye sight, height of vegetation preferences, temporal and diurnal separation.

The Hutchinson Theory is not supported in the current field study either, with the wallaby clearly in direct competition with the three larger herbivores on Kangaroo Island with the greatest competitor of the wallaby being the kangaroo. The pen trials only provided weak support for the Hutchinson Theory which provides only one explanation of competitive separation. Therefore, this theory is simplistic when there are many alternative explanations that allow dietary separation and reduce direct interspecific competition. This research highlights management issues that have important implications for the farmer and conservation managers on Kangaroo Island.

Declaration

This work is the result of my own investigation. The content herein has not been accepted for the award of any other degree or diploma in any university or other tertiary institution to Richard Bosworth and, to the best of my knowledge and belief, contains no material previously written or published by any other persons except where due reference is made in the text.

I give my consent for this thesis when deposited in the University Library, being made available for loan or photocopying, subject to the provisions of the Copyright Act 1968.

I also give permission for the digital version of my thesis to be made available on the web, via the University's digital research repository, the Library catalogue, the Australian Digital Thesis Program (ADTP) and also through web search engines, unless permission has been granted by the University to restrict access for a period of time.

The birth of the Aboriginal Flag occurred at Tarndanyangga / Victoria Square, Adelaide, in July 1971 at a land rights rally. Later that same year, the Aboriginal Flag was flown at the Aboriginal Tent Embassy in Canberra. Today, the Aboriginal Flag has become a powerful symbol for Reconciliation and hope for many Indigenous and non-Indigenous people throughout Australia.

The Aboriginal Flag was designed by Harold Thomas. Harold is a Luritji man who currently resides in the Northern Territory. Harold was born in Alice Springs and was the first Aboriginal person to graduate from an Australian Art School.

The Aboriginal Flag is divided horizontally into two equal halves of black and red, with a yellow circle in the centre. The black symbolises Aboriginal people; the red symbolises the mother earth and the ochre, which is used by Aboriginal people in ceremonies, the yellow, the sun, the constant giver and renewer of life.

I would like to acknowledge the Ngarrindjerri and Kurna people who are the traditional owners of the land where my research work was conducted and completed. I am also very respectful of the sensitivity of conducting research on a sacred site and I am grateful for

the Elders of the Ngarrindjerri Nation for giving me permission to access Kangaroo Island, for without this permission I would not have undertaken this research project.

Throughout my tertiary educational journey, Wilto Yerlo at the University of Adelaide has provided cultural support, a sense of where I belong and personal support without any reservations since 2000, when I started this journey with the Foundation Science course. To Professor Roger Thomas, Dean of Aboriginal Education: Wilto Yerlo and the whole team both past and present, thank you. Daniel Turner your support and friendship have made this journey possible, you have always had a friendly ear to listen to my problems (except when you have been on bloody holidays) and I sincerely thank you with all of my being. To all the members of the Indigenous Research Focus Group, thank you, for your words of wisdom, encouragement and cultural grounding.

To my supervisory team Dr Philip Stott and Professor Gordon Howarth thank you for your help, assistance and advice through my candidature. I am eternally grateful to Phil who passed on so much knowledge in dealing with the many animal husbandry problems that arose with the four herbivore species both wild and domestic.

Financial support has been a vital component for my research, for without the support this research would not have been possible. I am very proud and yet humbled and astounded to be the first Indigenous PhD Candidate in the Faculty of Sciences at the University of Adelaide. The University of Adelaide through the Faculty of Sciences has provided a Divisional Scholarship for my living cost for the three and a half years of my research, while the Federal Government has provided essential assistance for both living expenses through Abstudy and my total project cost through the Discovery Indigenous Researchers Development Grant from the Australian Research Council.

This project was authorised by the University of Adelaide Animal Ethics Committee, approval numbers S-103-2006 and S-047-2008 and scientific research permit for the capture and keeping of wildlife from the Department for Environment and Heritage, permit number G25303.

To the staff at Animal and Plant Control Board on Kangaroo Island, especially Keith Hodder and Pip Masters, thank you for your assistance in helping me to find property owners where all four herbivore species were present, and were also willing to help with this research. Property owners Duncan and Coral Correll at Western River and Borda Vale manager Neil and Annie Arnald at Cape Borda, thank you for hospitality and for providing access to your properties for faecal collection on the many occasions, enabling the establishment of the extent of competition in the area.

Thank you to all of the people, too many to name individually, that have assisted with this project in various ways, your contributions were very much appreciated.

To my family; especially Lois, my wife and life partner: I am grateful to you all for your love, encouragement and patience. Thank you for your understanding and always being there for me. Lois you are my rock and an inspiration to me by the way you push through adversity and never let your health issues prevent you from providing assistance to my project when required. I am eternally grateful for your companionship during the field trips on Kangaroo Island and your assistance with capturing and handling of my research animals.
