ABSTRACT

Background: Atrial Fibrillation (AF) is the most common atrial arrhythmia affecting Australia and the world, with patients with AF known to be at a 5times higher risk of stroke than that of the normal population. The substrates of AF are also known to significantly impact of this risk of stroke. Mitral stenosis (MS) is one of the leading causes of valvular AF in the developing world. Enlargement of the LA is one of the most common structural changes that occurs in MS and is known to lead to fibrosis and oxidative stress. These alterations can also cause atrial electrical remodelling leading to the development of AF. Patients with MS have been shown to have an increase in thrombogenic properties which include platelet reactivity, inflammation and endothelial dysfunction.

The precise mechanisms which underlie this phenomenon of atrial thrombus formation in AF are still unknown, furthermore it is also unknown if the substrate (cause) of AF influences the thromboembolic profile in AF patients. This thesis aims to evaluate the peripheral and atrial thrombogenic profile of both AF and the major substrate MS and their differing disease states alter the thrombus potential.

Methods: A total of 166 patients were collected for this study, 55 patients undergoing a radiofrequency ablation as a curative procedure for paroxysmal AF, at the Royal Adelaide Hospital, Adelaide, 59 patients with mitral stenosis (MS)undergoing a balloon valvuloplasty at
the Christian Medical Centre in Vellore, India, and 52 with aged matched control subjects, diagnosed with left sided accessory pathway supraventricular tachycardia (SVT) undergoing a routine elective electrophysiological study. Blood samples were collected from the peripheral, RA and LA circulation, during each of these procedures, for further analysis through flow cytometry, platelet aggregation and ELISA tests. Echocardiographic studies were used for atrial structure measurements.

**Results:** We found that within the AF population there is increase in thrombogenic markers within the heart compared to the peripheral circulation. More interestingly when comparing the MS and AF populations each of the different factors involved in thrombogenesis is altered differently, with AF having an increase in platelet reactivity and endothelial function (ADMA and ET-1) and inflammation through VCAM-1 and ICAM-1. However of inflammation through MPO, CD40L and IL-6 and structural remodelling (MMP-9 and TIMP-1) were more pronounced within the MS population.

**Conclusion:** This study has shown that AF and the valvular AF substrate mitral stenosis (MS) have two distinctly different mechanisms leading to atrial thrombus formation. This shows that MS as a substrate for valvular AF impacts on atrial thrombus formation through remodelling and inflammation whereas non valvular AF affects endothelial function and tissue inflammation. This illustrates that the
pathophysiology of each of the diseases states is different when comparing it to the normal haemostatic properties of the heart within a control (SVT) population to determine if these factors are in fact altered from the norm.
DECLARATION

I certify that this work contains no material which has been accepted for the award of any other degree or diploma in my name, in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text. In addition, I certify that no part of this work will, in the future, be used in a submission in my name, for any other degree or diploma in any university or other tertiary institution without the prior approval of the University of Adelaide and where applicable, any partner institution responsible for the joint-award of this degree.

I give consent to this copy of my thesis when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act 1968.

The author acknowledges that copyright of published works contained within this thesis resides with the copyright holder(s) of those works. I also give permission for the digital version of my thesis to be made available on the web, via the University’s digital research repository, the Library Search and also through web search engines, unless permission has been granted by the University to restrict access for a period of time.

ACKNOWLEDGEMENTS

I wish to use this opportunity to thank those people who have been involved, supported and encouraged me through my studies over the last four years.

I would like to thank all my supervisors, Dr Anthony Brooks, Dr Bobby John, Dr Anand Gasean and Prof Prash Sanders for their guidance, supervision, help and support for the duration of my PhD.

In particular I would like to thank my primary supervisor Dr Scott Willoughby for his guidance, encouragement and mentorship throughout this time which has been a blessing. Thank you for believing in me, giving me confidence and courage to begin and the support to complete a PhD.

I am grateful for the postgraduate scholarship support I received from the Australian Government and University of Adelaide for the Australian Postgraduate Award. I am also grateful for the patients who volunteered their additional time for this research.

This thesis research was done over two continents as a part of the Australia India Strategic Research Fund (BF030018). A collaboration with the Royal Adelaide Hospital in Adelaide, South Australia, and the Christian Medical College in Vellore, India.
I am very thankful to all of the staff at the Cardiovascular Investigation Unit, Royal Adelaide Hospital and Centre for Heart Rhythm Disorders, University of Adelaide, in particular Ms Judith Hunt, Ms Lauren Wilson, Ms Melissa Middeldorp and Ms Aimie Paukner for your help with sorting, rearranging, finding patients and information which has been a tremendous help.

Thank you to my family for providing support and enthusiasm during the course of my studies. My Parents, whose constant encouragement, support and love has helped tremendously; they always together with my brothers know how to bring me back down to earth and have always been a huge base of support.

Finally I would like to thank my fiancé Tom for his love, support, understanding and encouragement not only during the past few years but in all that I strive to achieve. This roller coaster ride of a PhD has seen our relationship grow and become something I could only have wished for, and will be forever grateful that he was right there next to me for the whole journey.

Thanks,

Carlee
